

# Changes in Weather and Climate Patterns during El Niño and La Niña

**The Pacific jet stream responds by strengthening & extending eastward during El Niño (weakening & retracting westward during La Niña).**

**Changes in the jet lead to changes in temperature and precipitation patterns, hence changes in the number & intensity of weather events, including extremes.**

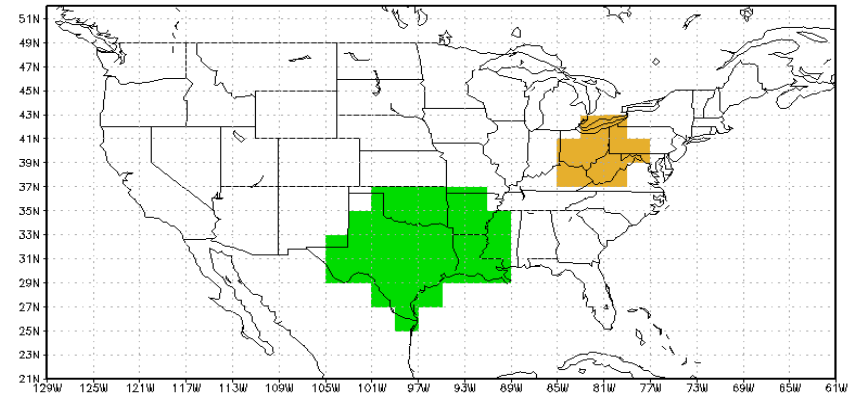

# Why were US T&P predictions unsuccessful in some ENSO years?

	Aug 2004	Sep 2004	Oct 2004	Nov 2004	Dec 2004

UNIVERSITY**

# What is the uncoupled El Niño warming?

*An uncoupled warming event is defined as an event with*

- (a) Monthly mean Niño3.4 index  $\geq 0.5^{\circ}\text{C}$ ;
- (b) Central Pacific OLR (CP\_OLR) index  $>0.0$ ;
- (c) (a) & (b) persist for at least 3 consecutive months.

# 4 uncoupled warming events since 1979

(Sep 1979-Feb 1980, Aug-Dec 2004, Oct 2014-Jan 2015, & Oct-Dec 2018)

Nino3.4 (5S–5N,170W–120W; Shading) & Normalized CP\_OLR (5S–5N,170E–140W; Line)  
(a) Jan1979–Dec2019

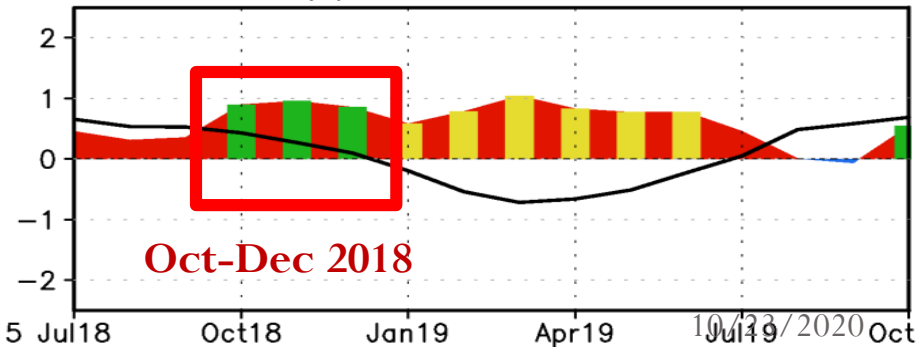

(b) Jul1979–Oct1980

(c) Jul2004–Oct2005

(d) Jul2014–Oct2015

(e) Jul2018–Oct2019

# Uncoupled El Nino: small SSTA zonal gradient & positive OLR

Monthly Mean SST (shading) & OLR (contour) Anomalies 5S-5N

(a) Jul1979–Nov1980

(b) Jul2004–Nov2005

(c) Jul2014–Nov2015

(d) Jul2018–Nov2019

(e) Jul1982–Nov1983

(f) Jul1997–Nov1998

- Zonal SSTA gradient  $\leftrightarrow$  Zonal Wind anomaly  $\leftrightarrow$  Convection/OLR  $\leftrightarrow$  ENSO
- NO Zonal SSTA gradient  $\leftrightarrow$  NO Zonal Wind anomaly  $\leftrightarrow$  NO Convection/OLR  $\leftrightarrow$  NO Coupling

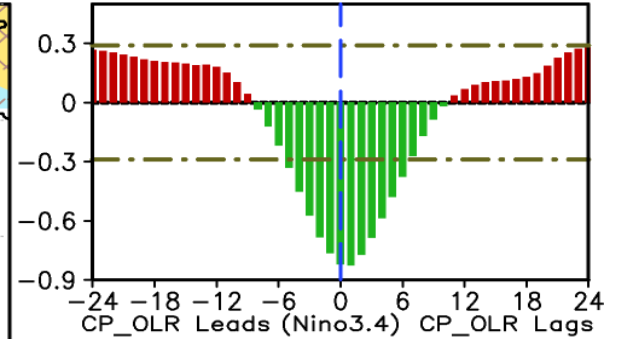

Composite of SST & UV1000 (95%)  
 (a) Nino3.4  $\geq 0.5$  & CP\_OLR  $< 0.0$

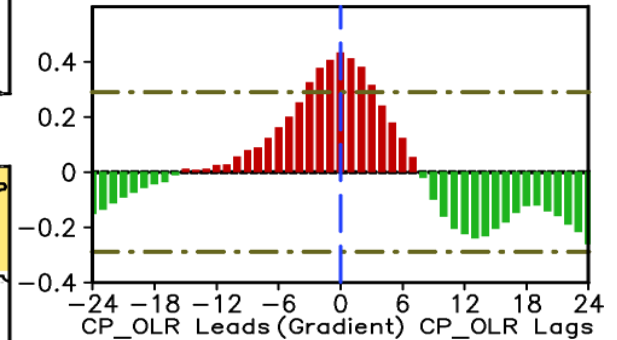

(b) Nino3.4  $\geq 0.5$  & CP\_OLR  $\geq 0.0$

Lead & Lag Corr (95%)  
 (c) CP\_OLR & Nino3.4

(d) CP\_OLR & Gradient (C-E)

(e) U & Gradient (C-E)

# Pacific-North American (PNA) Pattern

Without  
tropical  
convection,  
there will be  
**NO**  
extratropical  
response.

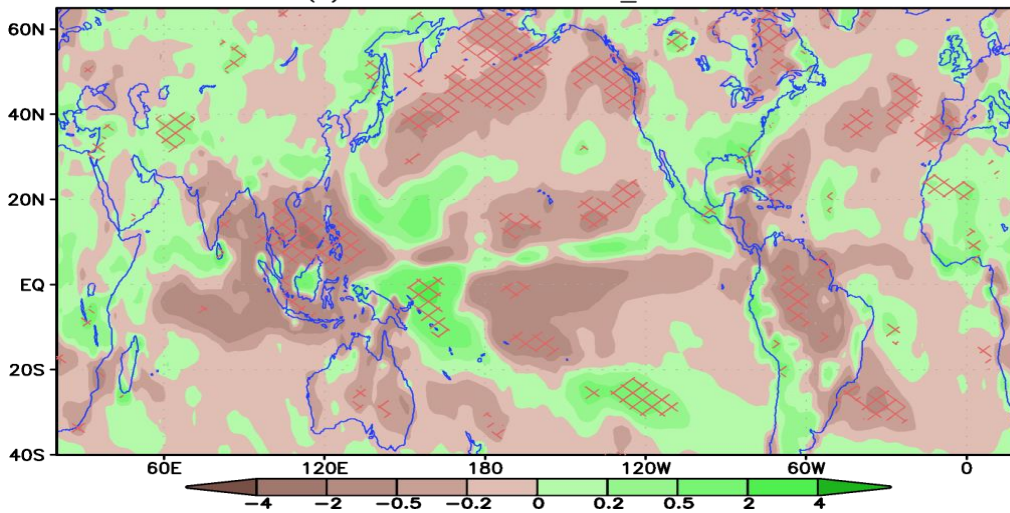

# Coupled El Nino

Monthly Mean Prate Anomaly (CAMS\_OPI, Jan1979–Dec2019; 95% T-test)  
(a) Nino3.4 >= 0.5 and CP\_OLR < 0.0

(b) Nino3.4 >= 0.5 and CP\_OLR >= 0.0

- Coupled composite is more significant than uncoupled one;
- CPC official forecast skill of T/P in El Niño is higher than uncoupled one;
- **So we must distinguish uncoupled El Niño from coupled one.**

CPC Official Forecast Heidke Skill Scores of Monthly P (Line) & T (Bar) in USA (Jan1995–Dec2019)

# Uncoupled El Niño

Consistently, the zonal gradients overall increased

→ implying potential of increase of uncoupled El Nino warming

Mean (contour, 1979–2018) & Difference (shading): (2000–18)–(1979–99) (95%, T-test)

(a) SST (C)

(b) Prate (mm/day)

(c) H300 (C)

(d) Zonal Wind Stress (0.01 N/m\*\*2)

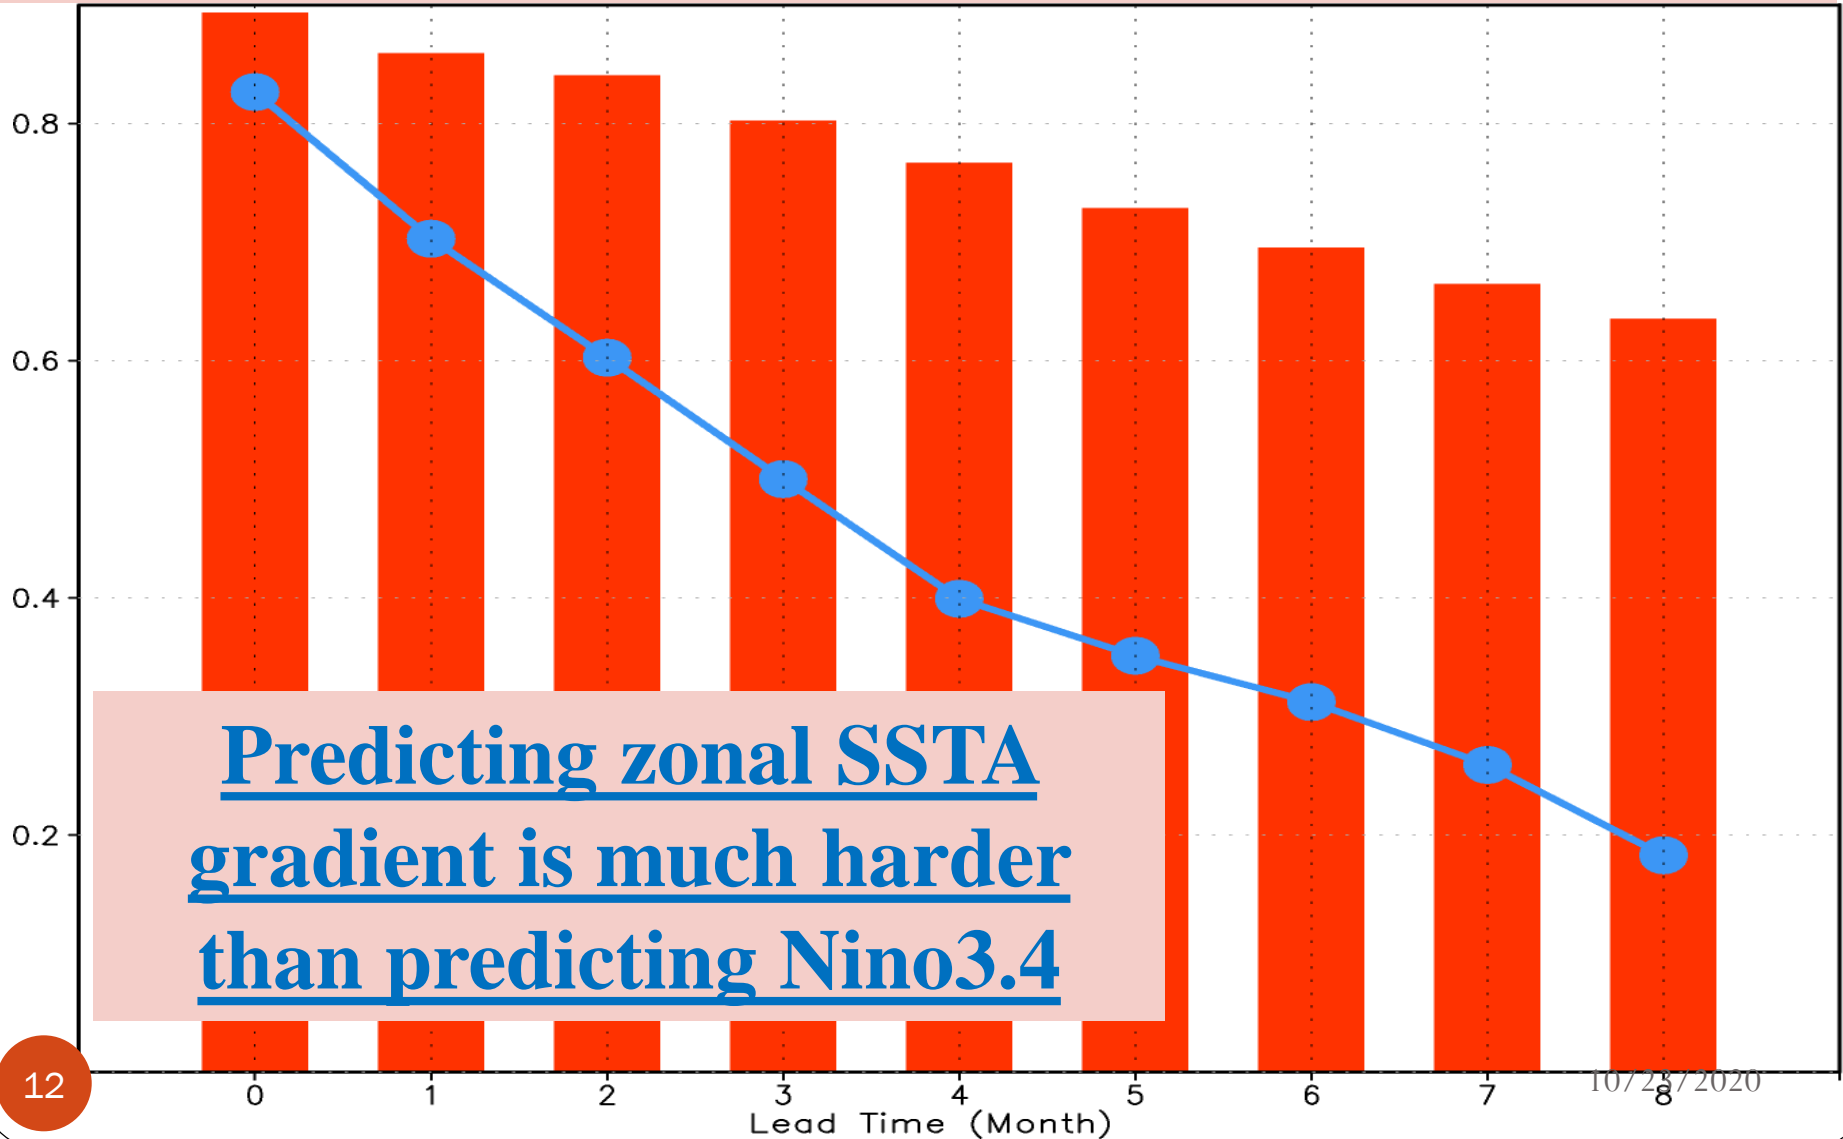

**Fig. S3. Time series of unfiltered (red) and residual (blue) zonal SST gradient index for (a) SON and (b) all three-month seasonal means.**

*Johnson et al. GRL 2019: zonal SST gradient index is defined as the difference between the standardized SSTA averaged over a box near Papua New Guinea ( $10^{\circ}\text{S}$ – $10^{\circ}\text{N}$ ,  $130^{\circ}\text{E}$ – $170^{\circ}\text{E}$ ) and the standardized SSTA averaged over a box in the central Pacific ( $10^{\circ}\text{S}$ – $10^{\circ}\text{N}$ ,  $180^{\circ}$ – $140^{\circ}\text{W}$ ).*

**Lead-time dependent prediction skill of CFSv2 predicted Niño3.4 (bar) and zonal gradient of SSTA (the central (5°S-5°N, 160°E-160°W) minus the eastern (5°S-5°N, 120°W-90°W) tropical Pacific; line) indices. The skill is defined as the linear correlation between the ensemble mean of 20 forecast members and observations in Jan 1982-Dec 2018**

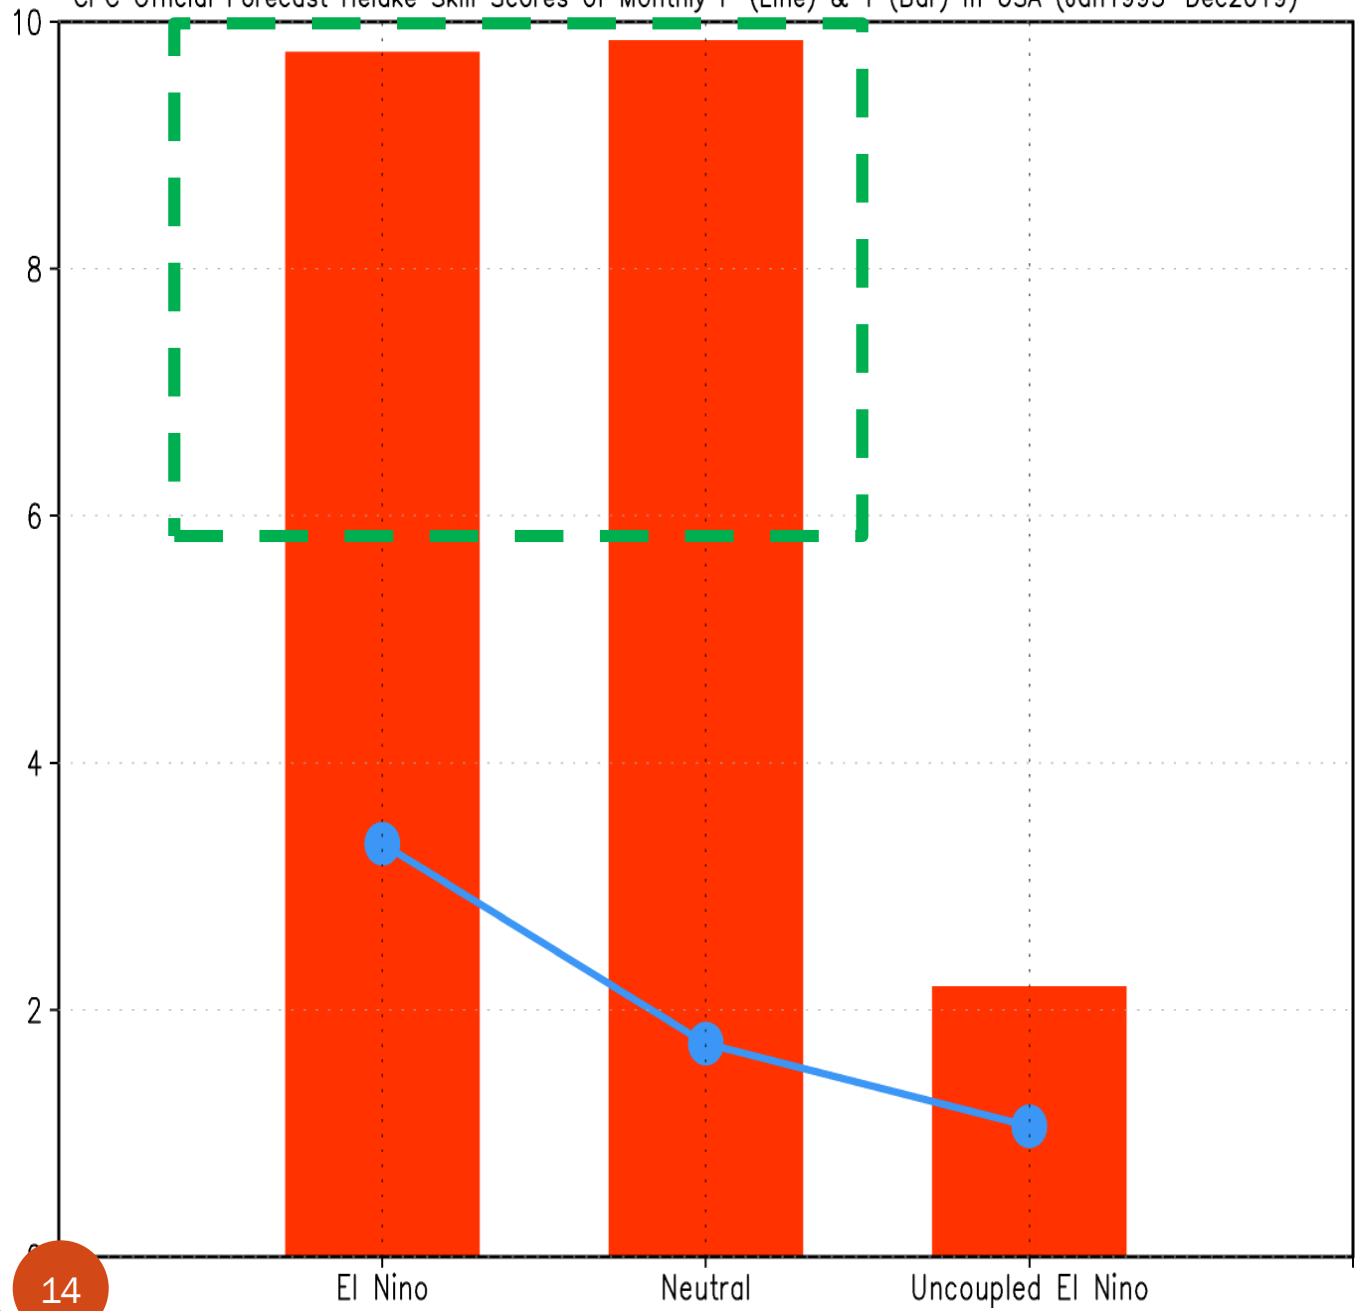

**Predicting zonal SSTA  
gradient is much harder  
than predicting Niño3.4**

# Summary and Conclusions

- In addition to various flavors of ENSO, oceanic warming in the central and eastern tropical Pacific sometimes is not accompanied by corresponding atmospheric anomalies, i.e., atmosphere and ocean remain uncoupled.
- Such uncoupled warm events happened in 1979, 2004, 2014, and 2018. A weaker zonal gradient of SSTA across the tropical Pacific compared with that in a conventional El Niño may partially account for the decoupling.
- Without coupling, the impact of the El Niño warming on extratropical climate may also be different from that of its coupled counterpart, implying an additional challenge for seasonal climate prediction.
- The enlarged zonal contrast trend across the tropical Pacific may be associated with more frequent uncoupled El Niño warming since 1999/2000.

CPC Official Forecast Heidke Skill Scores of Monthly P (Line) & T (Bar) in USA (Jan1995–Dec2019)

**El Niño seems no contribution to temperature forecast skill during 1995-2019.**

**Why?**
