MME and Individual Models' Skill for BSISO

ISVHE

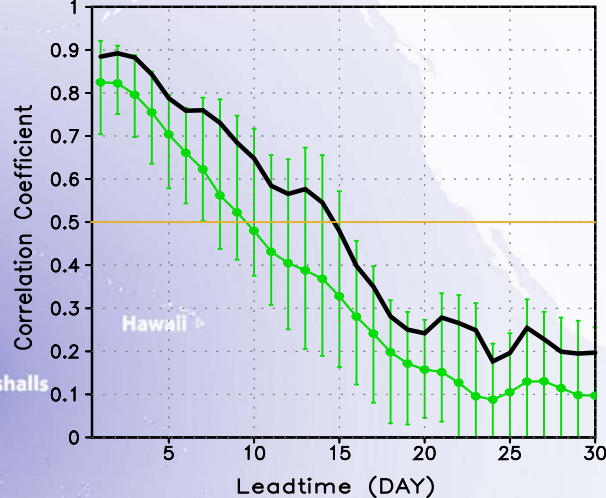

Correlation Coefficients (1989-2008, MJJASO)

BSISO1

(a) BSISO1-1

(b) BSISO1-2

Common Period: 1989-2008
Initial Condition: 1st day of
each month from Oct to
March

MME: Simple composite
with all models

BSISO2

(a) BSISO2-1

(b) BSISO2-2

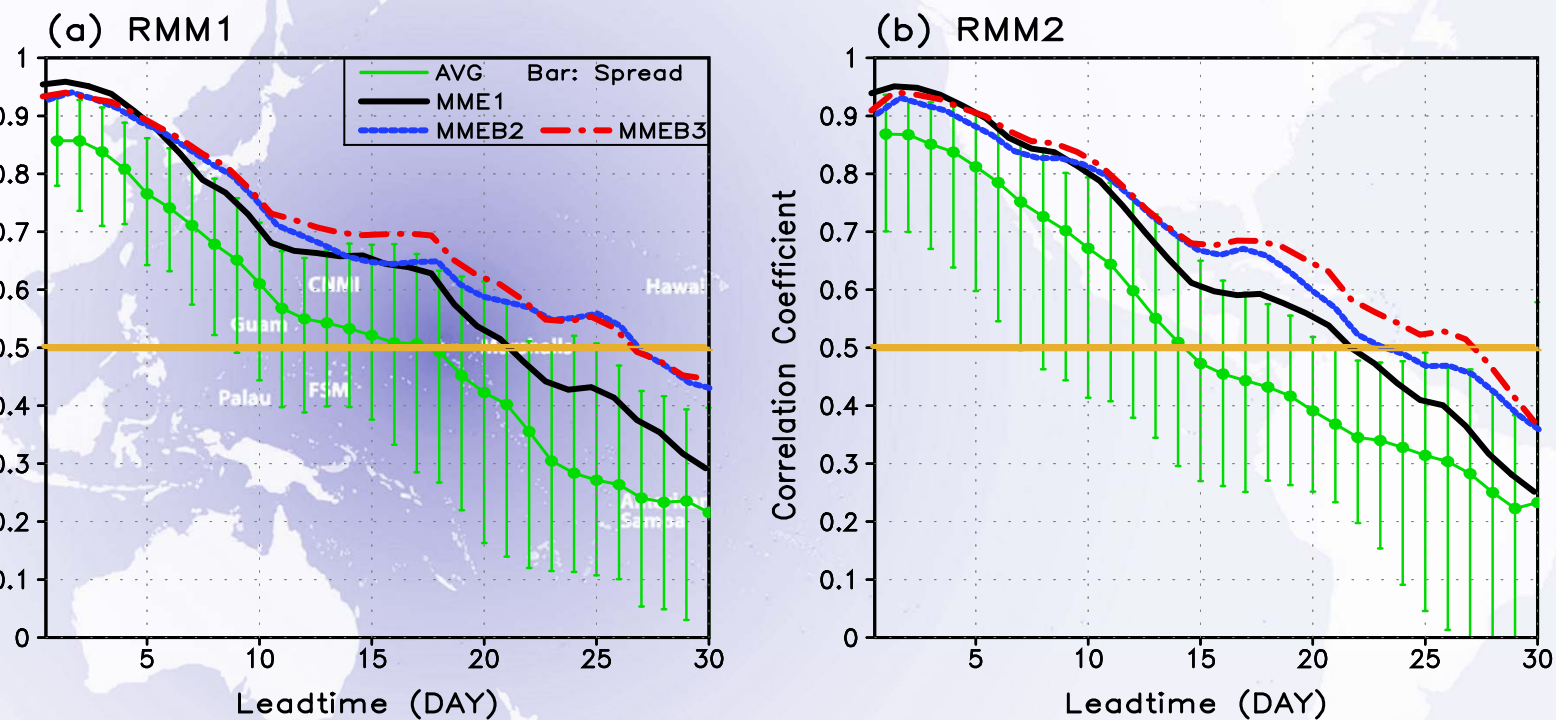

Using the MME, forecast skill
for BSISO1 reaches 0.5 at 15
to 20-day forecast lead and
for BSISO2 at 10- to 15-day
forecast lead.

MME and Individual Model Skills for MJO

ISVHE

Anomaly Correlation Coefficients (1989-2008, NDJFMA)

Common Period: 1989-2008

Initial Condition: 1st day of each month from Oct to March

MME1: Simple composite with all models

MMEB2: Simple composite using the best two models

Composite for initial MJO phase 3 in CFSv2 (1999-2010)

Summary

Successive MJO is more predictable than primary MJO. Major problems of operational models are: Slow eastward propagation, Maritime Continent barrier, and weak intensity.

MJO forecast skills are about 14 days in GFS and 25 days in CFSv2 and UH models for entire DYNAMO period. CFSv2 model has lower skill during IOP due to weak eastward propagation.

Intraseasonal SST anomaly (or air-sea coupling) and advanced stratiform rainfall significantly improve MJO forecast skill.

Kelvin vs. Madden and Julian ?

18-NOV-2011 00:00 SOURCE: METEO-FRANCE & IPSL

Michelle Nov 18, 2011 05:26 AM

Hey Adam,
I think you're right about the Kelvin wave. You can see it pretty well here on Carl Schreck's webpage:
<http://monitor.cicsnc.org/mjo/current/how/olr.waves.EQ.gif>

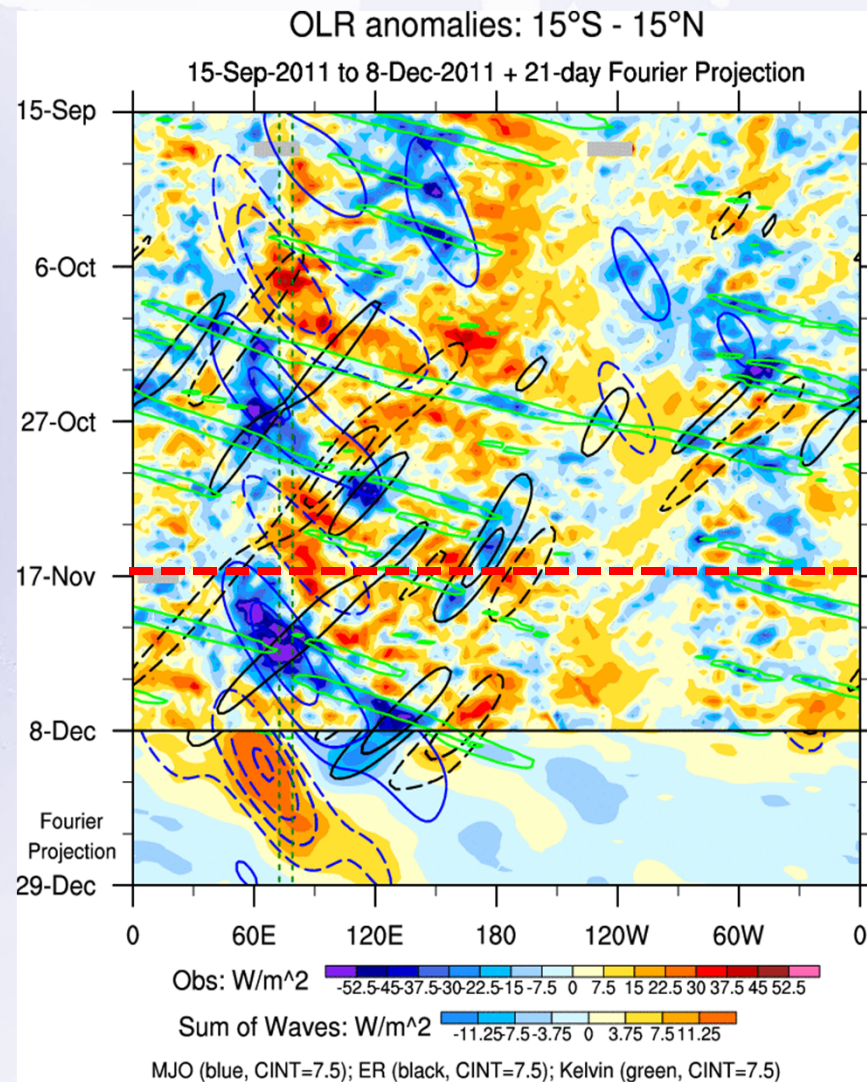

See the green contours impinging onto the DYNAMO domain (shown by the vertical dashed line)

<http://monitor.cicsnc.org/mjo/>
