

Table of Contents

Foreword by Edward N. Lorenz

(Title page, Dedication), Preface

Acronyms and notions

List of symbols

Chapter 1. Introduction

Chapter 2. Background on Orthogonal Functions and Covariance

2.1 Orthogonal Functions

2.2 Correlation and Covariance

2.3 Issues about removal of “the mean”

2.4 Concluding remarks

Inset/Appendix: The anomaly correlation.

Chapter 3 Empirical Wave Propagation

3.1 Data and EWP method

3.1.1 Data treatment.

3.1.2 Amplitude

3.1.3 Phase shifting

3.1.4 Mean propagation

3.1.5 EWP forecast method.

3.2 EWP diagnostics

3.3 Rock in the pond experiments.

3.4 Skill of EWP 1-day forecasts.

3.5 Discussion

3.5.1 Eulerian and Lagrangian Persistence

3.5.2 Reversing time and targeted observations

3.5.3 Application of EWP

3.5.4 Historical note

3.5.5 Weak points of EWP

Inset or Appendix 1 : EWP formal derivation

Inset 2: The Rossby equation

Chapter 4 Teleconnections

4.1 Working Definition.

4.2 Two most famous examples in NH

4.3 The measure of teleconnection

4.4 Finding teleconnections systematically (EOT)

- 4.5 Discussion
- 4.6 Monitoring, indices and station data

Chapter 5. Empirical Orthogonal Functions

5.1 Methods and definitions

- 5.1.1 Working definition
- 5.1.2 The Covariance Matrix
- 5.1.3 The Alternative Covariance Matrix
- 5.1.4 The covariance matrix: context
- 5.1.5 EOF through eigen-analysis
- 5.1.6 Explained variance EV

5.2 Examples

5.3 Simplification of EOF - EOT

5.4 Discussion of EOF

- 5.4.1 Summary of procedures and properties
- 5.4.2 The spectrum
- 5.4.3 Interpretation of EOF
- 5.4.4 Reproducibility (sampling variability)
- 5.4.5 Variations on the EOF theme
- 5.4.6 EOF in models:
- 5.4.7 More examples
- 5.4.8 Common misunderstandings
- 5.4.9 Closing comment

Inset or Appendix I

Inset or Appendix II. Iteration

Chapter 6. Degrees of Freedom

- 6.1 Methods to estimate effective degrees of freedom (N)
- 6.2 Example
- 6.3 Link of degrees of freedom to EOF
- 6.4 Remaining questions
- 6.5 Closing comments

Chapter 7. Analogues

7.1 Natural Analogues

- 7.1.1 Similarity measures
- 7.1.2 Search for 500 mb height analogues.
- 7.1.3 How long do we have to wait?
- 7.1.4 Application of Natural Analogues

7.2 Constructed Analogues

- 7.2.1 The idea
- 7.2.2 The method of finding α_j

- 7.2.3 Example of the weights
- 7.3 Specification or Downscaling
- 7.4 Global Seasonal SST Forecasts
- 7.5 Short range forecasts and dispersion experiments
 - 7.5.1 Short range forecasts
 - 7.5.2 CA Dispersion Experiment
- 7.6 Calculating the Fastest Growing Modes by Empirical Means
 - 7.6.1 Growing modes
 - 7.6.2 Example.
 - 7.6.3 Discussion

Appendix: Forecasts with CA

Chapter 8 Methods in Short-Term Climate Prediction

- 8.1 Climatology
- 8.2 Persistence
- 8.3 Optimal Climate Normals
- 8.4 Local Regression
- 8.5 Non-Local Regression and ENSO
- 8.6 Composites
- 8.7 Regression on the Pattern Level
 - 8.7.1 The time lagged covariance matrix
 - 8.7.2 CCA, SVD and EOT2
 - 8.7.3 LIM, POP and Markov
- 8.8 Numerical Methods
- 8.9 Consolidation
- 8.10 Other methods
- 8.11 Methods not used

Appendix 1 Some practical space-time continuity requirements

Appendix 2 Consolidation by Ridge Regression

Chapter 9 The practice of short-term climate prediction

- 9.1 On the seasonal mean
- 9.2 Lay-out of the forecasts
- 9.3 Time scales in the seasonal forecast
- 9.4 Which elements are forecast, and by which methods?
- 9.5 Expressing uncertainty
- 9.6 Simplifications of the probability forecast (three classes)
- 9.7 Format of the forecast
- 9.8 The official forecast
- 9.9 Verification I - a-priori skill and hindcasts
- 9.10 Verification II - Heidke Skill Scores
- 9.11 Trends
- 9.12 Forecasts of Opportunity

Appendix: Historical Notes

Chapter 10 Conclusion

10.1 Linearity

10.2 Relative Performance GCMs and Empirical Methods

10.3 Predictability

10.4 The Future of Short-Term Climate Prediction
