Synopsis of Climate Modes

ENSO:

- **Not Active**

ENSO-Neutral conditions are slightly favored (between 55-60%) during the upcoming NH fall and winter 2016-17.

MJO and other subseasonal tropical variability:

- Weak intra-seasonal signal over the Maritime Continent
- Dynamical models indicate weakening in place during Week-1, then eastward propagation in Week-2. There is considerable uncertainty in the amplitude and phase of the signal.
- Kelvin waves also influencing the pattern.

Extratropics:

- The extended range temperature and precipitation forecasts for the U.S. are not likely to be impacted by the MJO, but more likely to be impacted by tropical cyclones (possibly Hawaii).

Global Tropics Hazards and Benefits Outlook - Climate Prediction Center

Week 1 - Valid: Oct 05, 2016 - Oct 11, 2016

Week 2 - Valid: Oct 12, 2016 - Oct 18, 2016

Confidence
High Moderate

- Tropical Cyclone Formation** Development of a tropical cyclone (tropical depression - TD, or greater strength).
- Above-average rainfall** Weekly total rainfall in the upper third of the historical range.
- Below-average rainfall** Weekly total rainfall in the lower third of the historical range.
- Above-normal temperatures** 7-day mean temperatures in the upper third of the historical range.
- Below-normal temperatures** 7-day mean temperatures in the lower third of the historical range.

Product is updated once per week, except from 6/1 - 11/30 for the region from 120E to 0, 0 to 40N. The product targets broad scale conditions integrated over a 7-day period for US interests only. Consult your local responsible forecast agency.

MJO Observation/Forecast

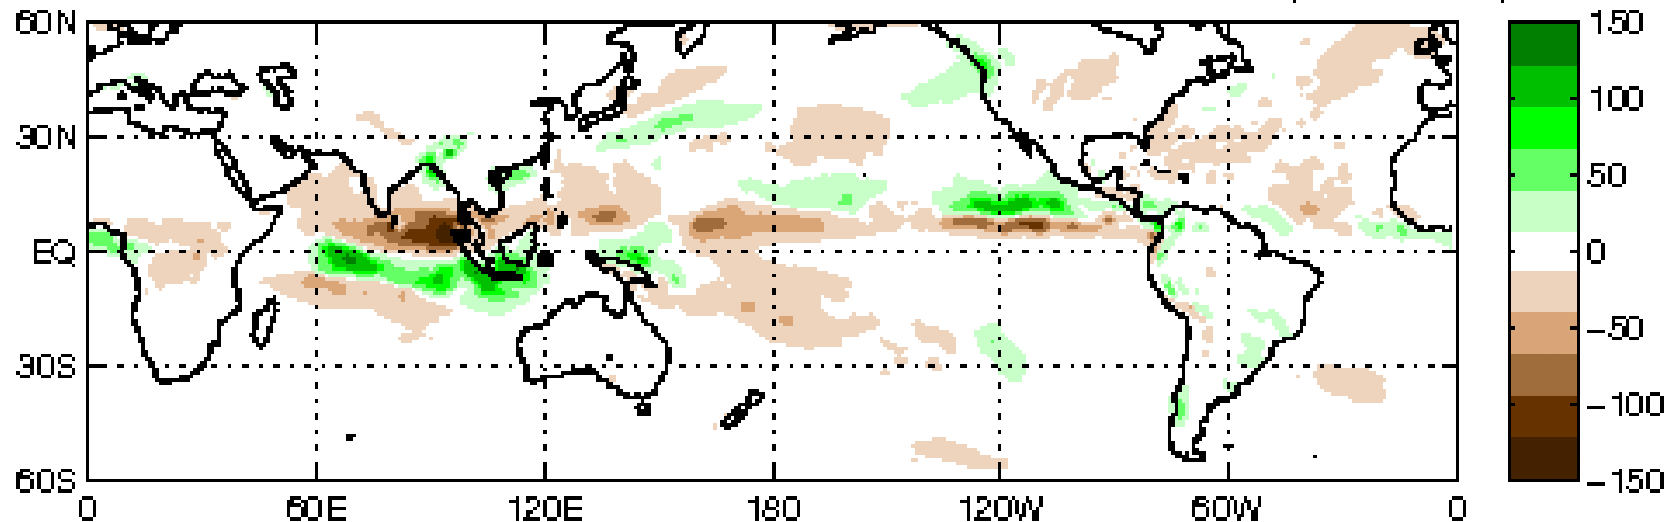

Wheeler-Hendon based analyses of model forecasts indicate a weakening signal in place for Week-1, then slight strengthening and eastward propagation during Week-2.
