

Global Ocean Monitoring: Recent Evolution, Current Status, and Predictions

Prepared by
Climate Prediction Center, NCEP/NOAA

October 10, 2023

<http://www.cpc.ncep.noaa.gov/products/GODAS/>

This project, to deliver real-time ocean monitoring products, is implemented
by CPC in cooperation with NOAA's Global Ocean Monitoring and Observing Program (GOMO)

- Overview
- Recent highlights
 - Pacific Ocean
 - Arctic & Antarctic Oceans
 - Indian Ocean
 - Atlantic Ocean
- Global SSTA Predictions

• Pacific Ocean

- El Niño conditions continued to grow in Sep 2023.
- The strong warming in the far eastern Pacific weakened in Sep 2023.
- NOAA “ENSO Diagnostic Discussion” on 14 Sep 2023 stated “*El Niño is anticipated to continue through the Northern Hemisphere winter (with greater than 95% chance through January - March 2024)*”.
- The PDO has been in a negative phase since Jan 2020 with PDOI = -2.1 in Sep 2023.
- Strong subsurface warming has persisted in the central north Pacific Ocean since 2020.

• Arctic and Antarctic Oceans

- Average Arctic sea ice extent during Sep 2023 ranked the fifth lowest Sep since 1979.
- Antarctic sea ice extent reached its annual maximum extent in Sep, hitting the lowest sea ice maximum in the satellite record.

• Indian Ocean

- A positive Indian dipole event continued to develop in Sep 2023.

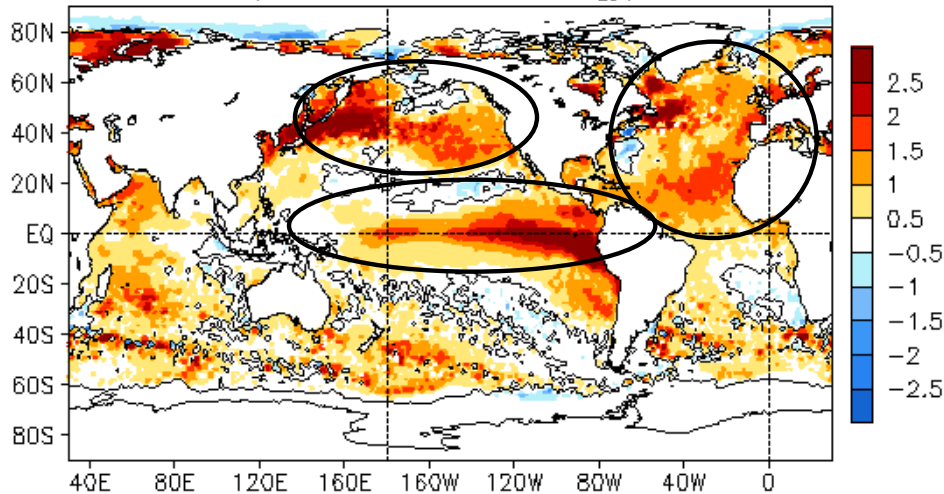

• Atlantic Ocean

- SST warming in the north Atlantic during Aug-Sep 2023 hit the historical high for the same season since 1982.
- Hurricane activity was active in Sep 2023.
- Marine heatwaves continued in west coast of North Africa, Caribbean, Gulf of Mexico and Labrador basin.

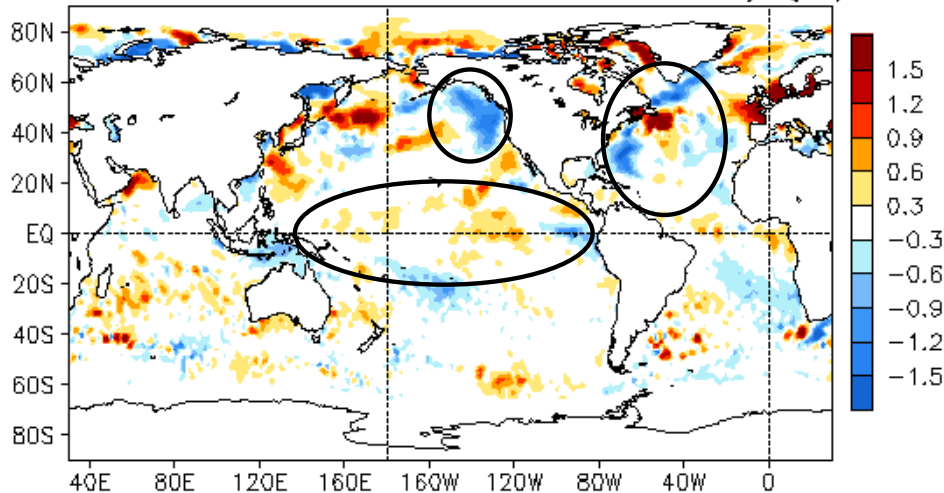

Global Oceans

Global SST Anomaly ($^{\circ}\text{C}$) and Anomaly Tendency

SEP 2023 SST Anomaly ($^{\circ}\text{C}$)
(1991–2020 Climatology)

SEP 2023 – AUG 2023 SST Anomaly ($^{\circ}\text{C}$)

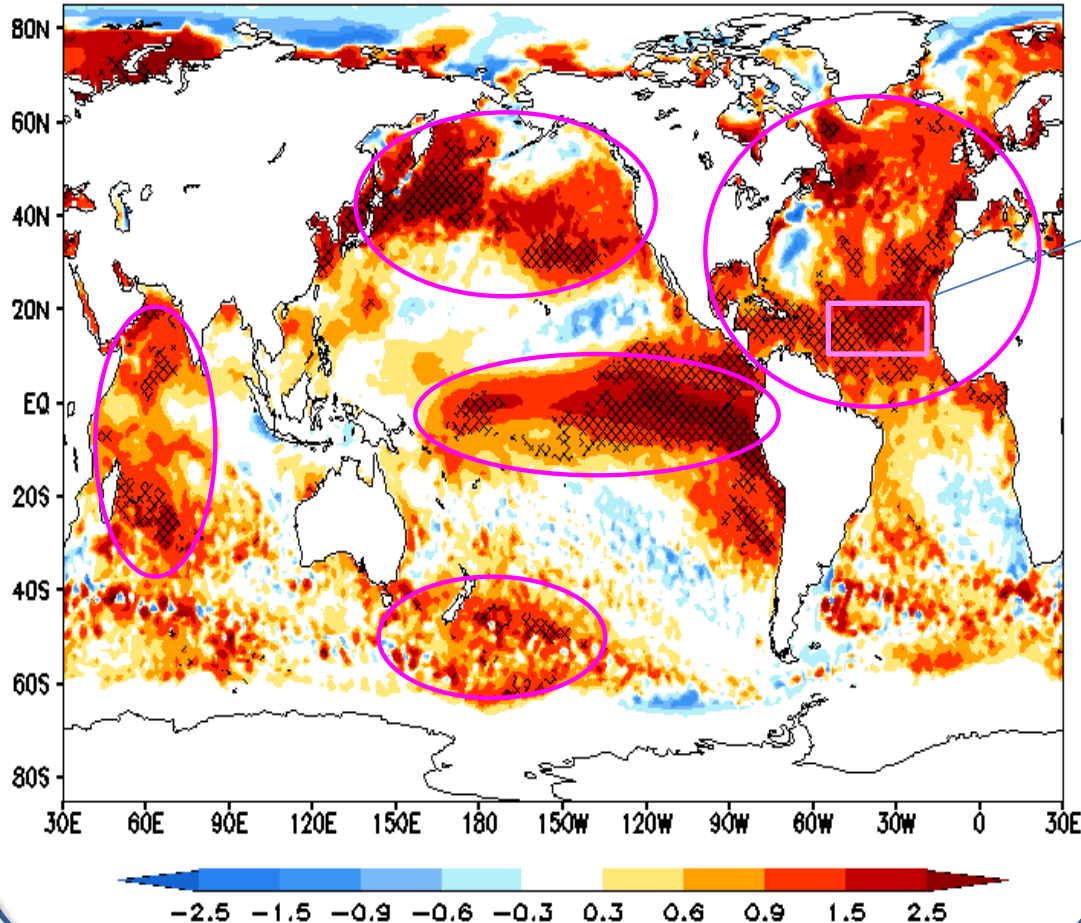

- SSTs were above average across most of the equatorial Pacific Ocean.
- Strong coastal El Niño condition continued in Sep 2023.
- Positive SSTAs persisted in the North Pacific.
- Positive SSTA dominated the Atlantic and Indian Oceans.

- Negative SSTA tendencies were observed in the Northeast Pacific Ocean.
- Large SSTA tendencies were observed in the mid-to-high latitude of the North Atlantic Ocean.
- Positive (negative) SSTA tendencies were present in the central-eastern equatorial (far eastern) Pacific Ocean.

SSTAs (top) and SSTA tendency (bottom). Data are derived from the Olv2.1 SST analysis, and anomalies are departures from the 1991-2020 base period means.

Global Monthly SST anomaly and Marine Heat Waves

OISSTv2.1 SEP2023 SST Anom. (°C)
Hatch area: MHW on SEP-2023-30

- MHWs were observed in the Northeast Pacific, Northwest Pacific, central-eastern equatorial Pacific, Southwest Pacific near New Zealand, Northeast Atlantic, Gulf of Mexico, Labrador basin and the western Indian Ocean.

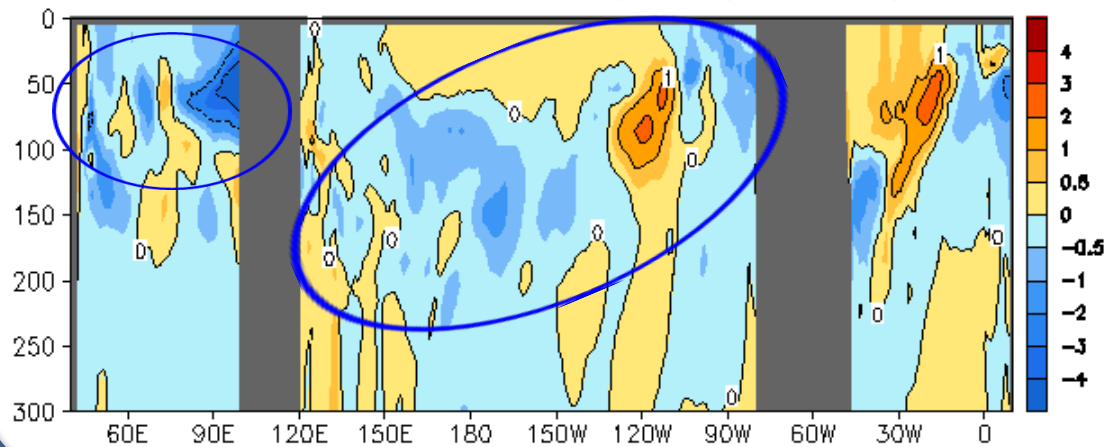

((Left panel) Monthly SST anomaly (shaded) and locations experiencing marine heat waves (hatched) by the end date labelled in the plot. (right panel) SST evolution at a specific location. Green line and blue line are the 90th percentile and daily climatology, respectively. Shaded area denotes the periods experiencing MHW. MHW is defined as a prolonged warming exceeding 90th percentile of daily SST for at least 14 consecutive days. Data is derived from NCEI OISSTv2.1 and the reference period is 1991-2020

Longitude-Depth Temperature Anomaly and Anomaly Tendency in 2°S-2°N

SEP 2023 Eq. Temp Anomaly (°C)
(GODAS, Climo. 91-20)

SEP 2023 - AUG 2023 Eq. Temp Anomaly (°C)

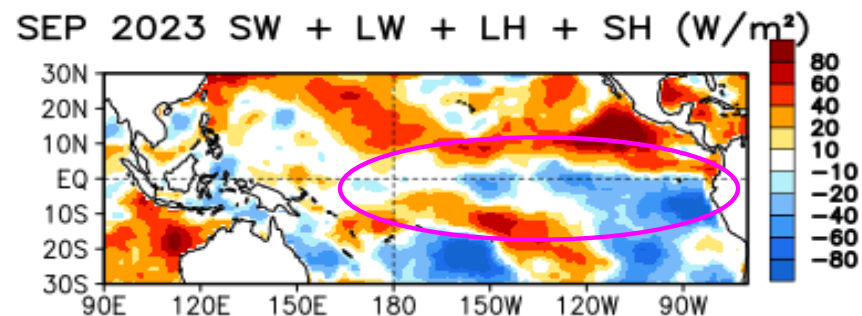

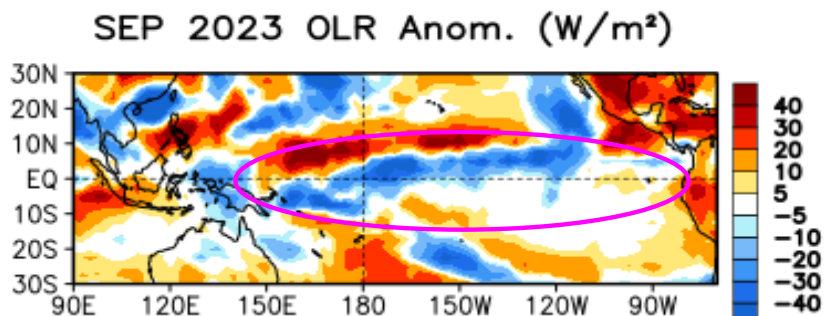

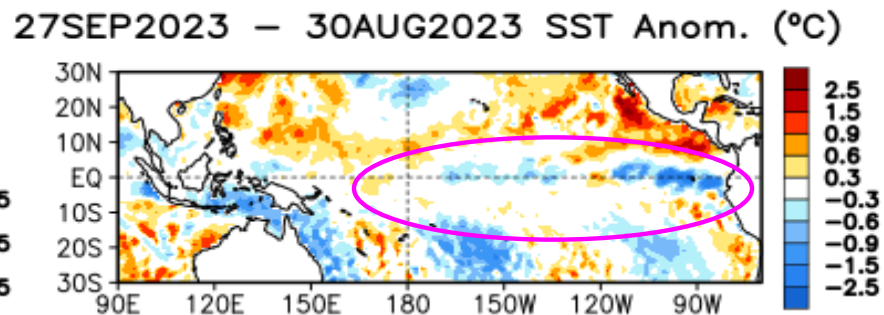

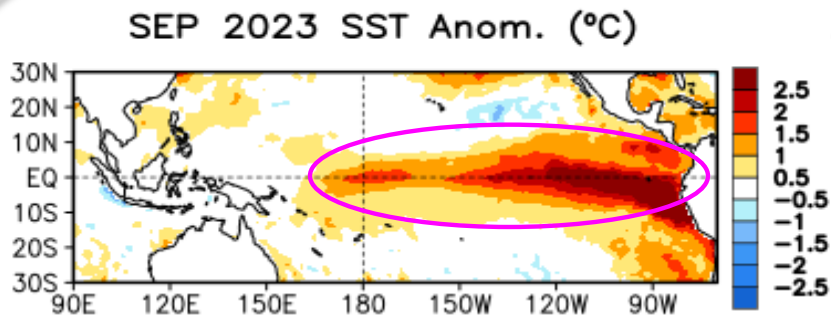

- Positive temperature anomalies were present along the thermocline in the Pacific.
- Negative(positive) temperature anomalies were observed along the eastern (western) thermocline in the Indian Ocean, favoring a positive IOD development.
- Negative temperature anomaly dominated the thermocline in the Atlantic Ocean.

- Negative temperature anomaly tendency dominated much of thermocline in the Pacific Ocean.
- Negative temperature anomaly tendency continued in the eastern Indian Ocean.

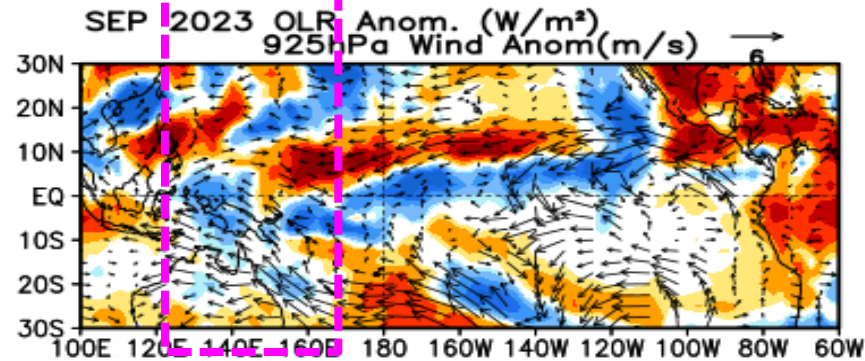

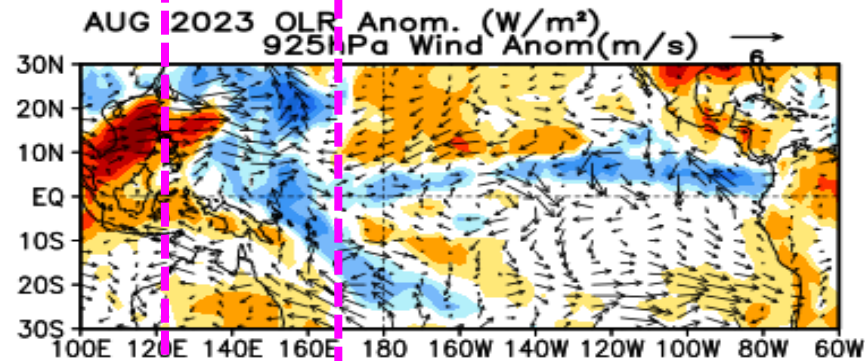

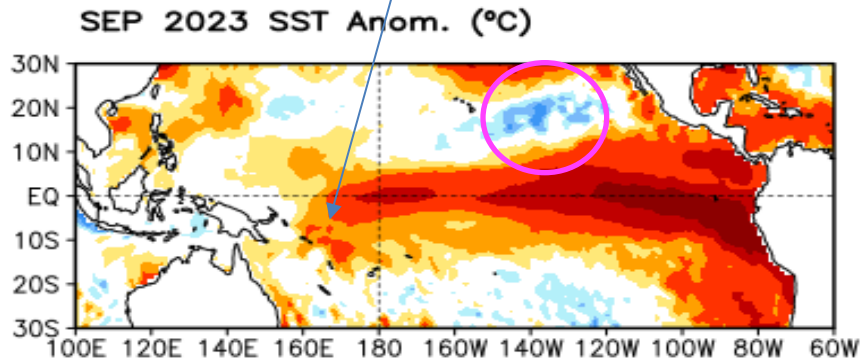

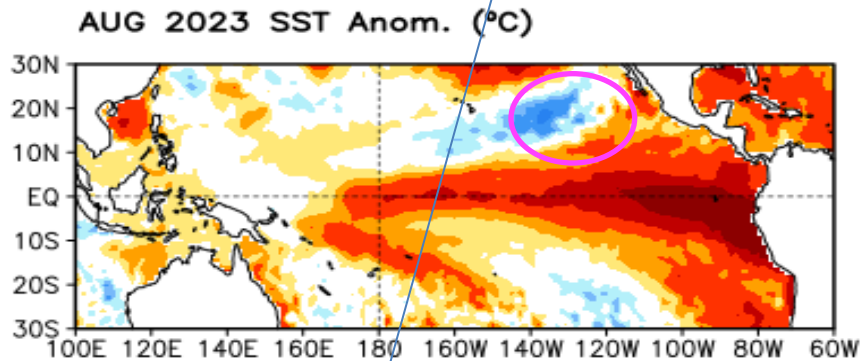

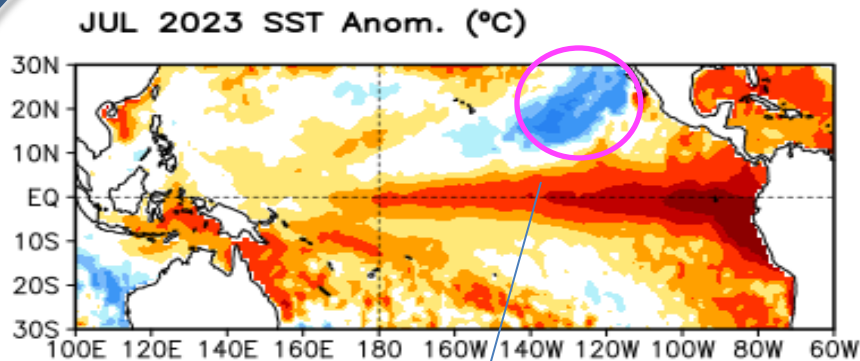

Equatorial depth-longitude section of ocean temperature anomalies (top) and anomaly tendency (bottom). Data is from the NCEP's GODAS. Anomalies are departures from the 1991-2020 base period means.

Tropical Pacific Ocean and ENSO Conditions

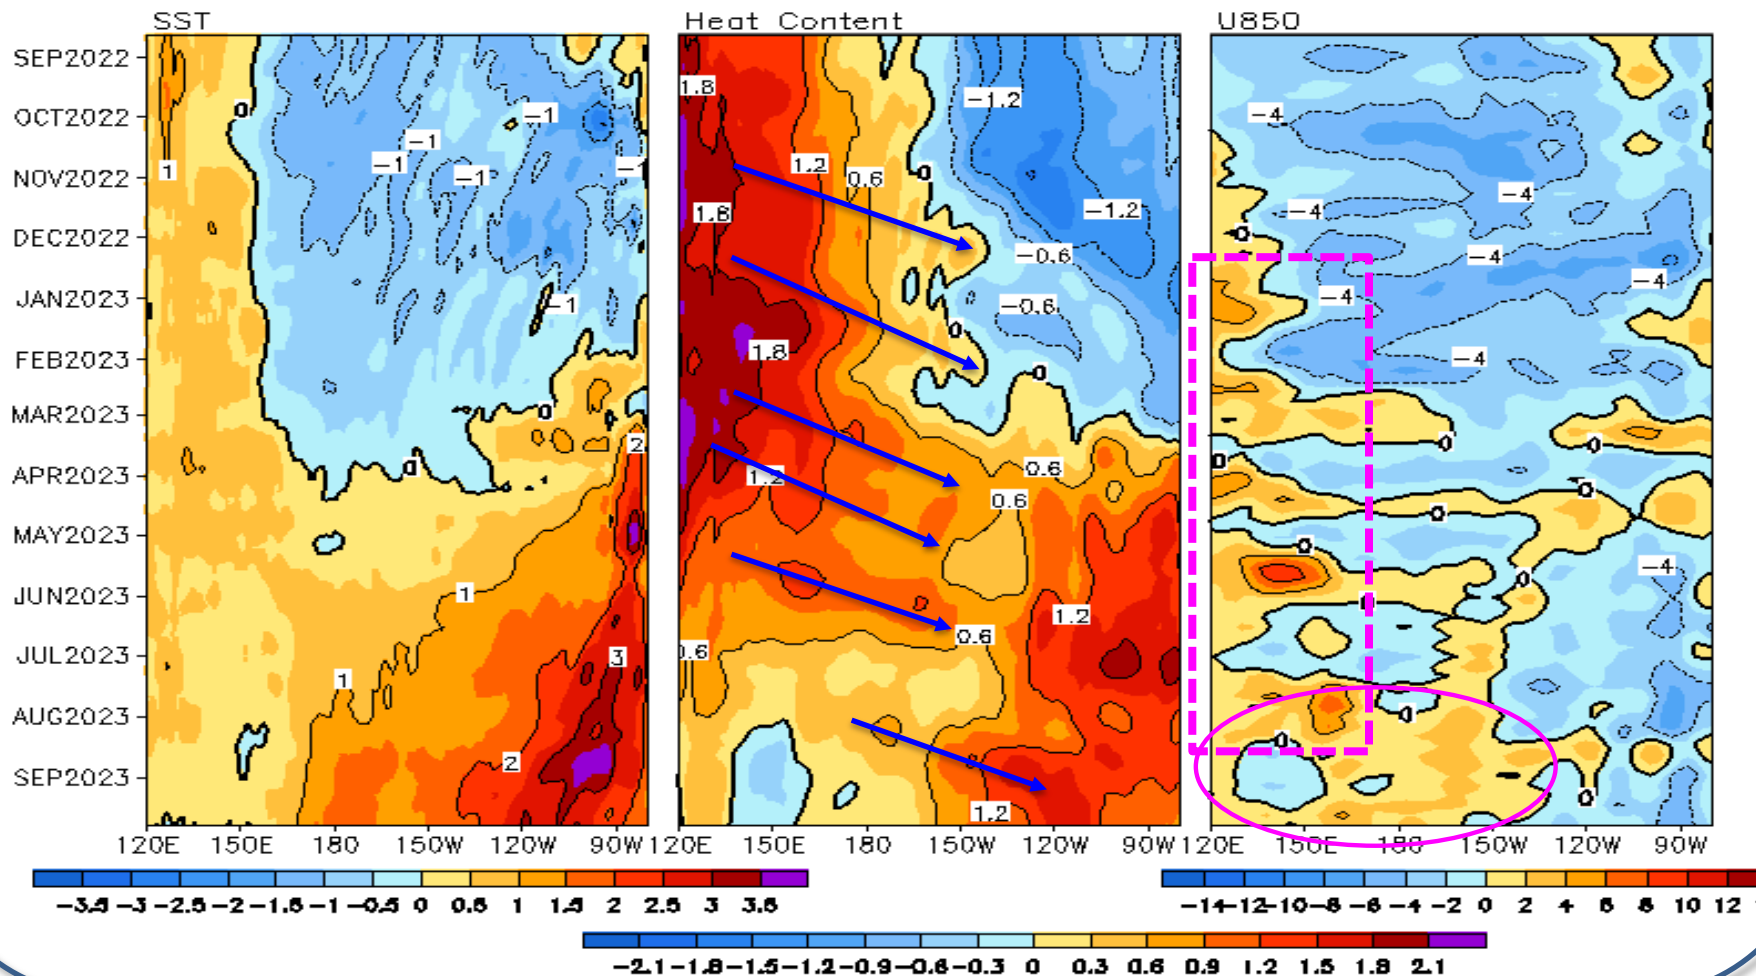

SSTAs (top-left), SSTA tendency (top-right), Outgoing Long-wave Radiation (OLR) anomalies (middle-left), sum of net surface short- and long-wave radiation, latent and sensible heat flux anomalies (middle-right; positive means heat into the ocean), 925-mb wind anomaly vector and its amplitude (bottom-left), 200-mb wind anomaly vector and its amplitude (bottom-right). SST are derived from the Olv2.1 SST analysis, OLR from the NOAA 18 AVHRR IR window channel measurements by NESDIS, winds and surface radiation and heat fluxes from the NCEP CDAS. Anomalies are departures from the 1991-2020 base period means.

Westward Expansion & Evolution of Coastal El Niño

Equatorial Pacific SST ($^{\circ}\text{C}$), HC300 ($^{\circ}\text{C}$), u850 (m/s) Anomalies

2°S–2°N Average, 3 Pentad Running Mean

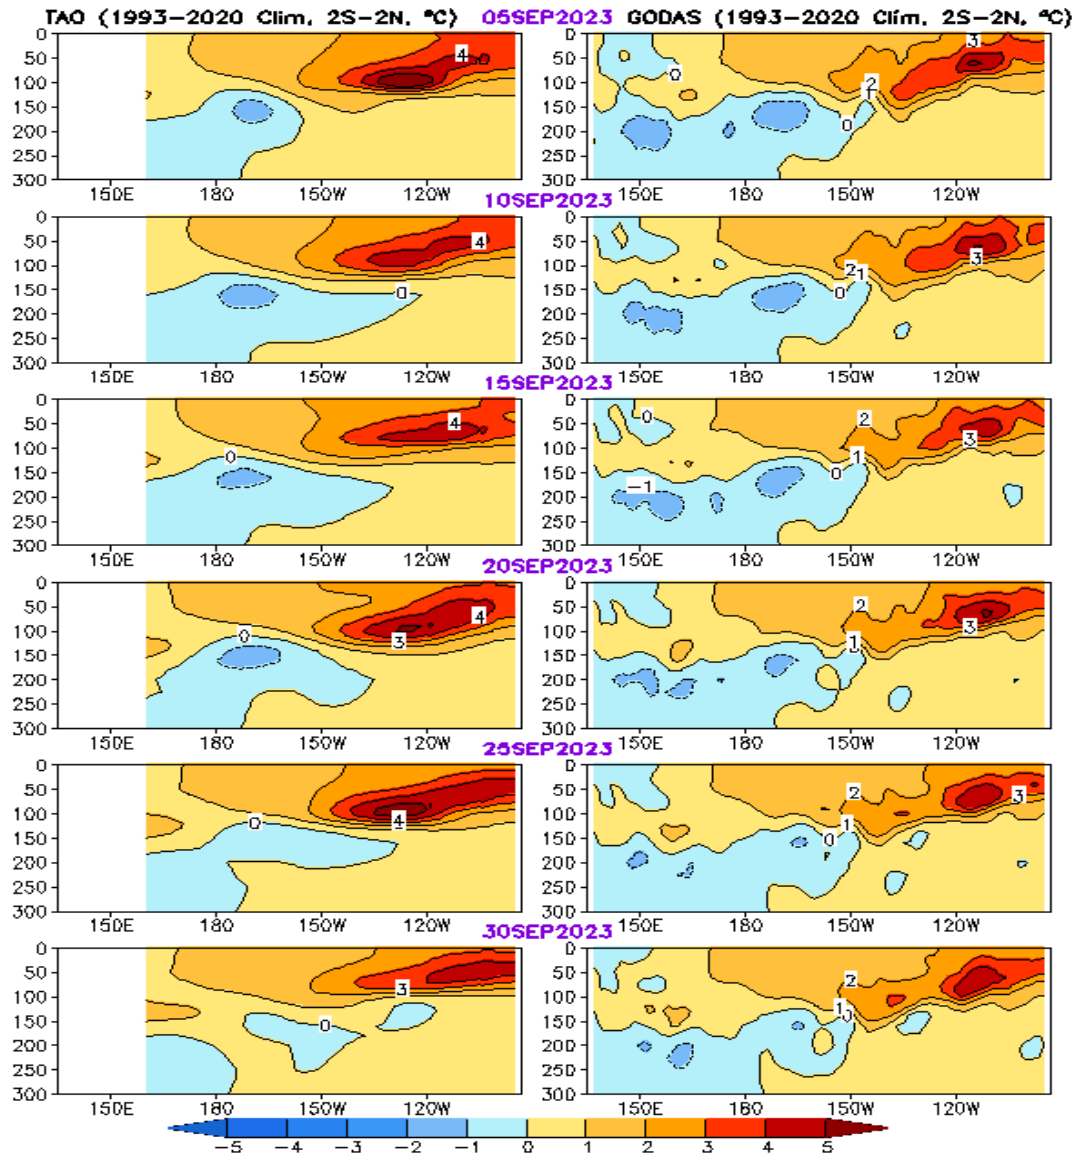

- Since Feb 2023, a set of westerly wind surges triggered downwelling Kelvin waves, helping to reinforce the subsurface warming in the central-eastern Pacific.
- Positive SST anomalies continued to strengthen and expanded westward.
- Westerly wind anomalies dominated over the western-central equatorial Pacific Ocean in Sep 2023.

Equatorial Pacific Ocean Temperature Pentad Mean Anomaly

TAO

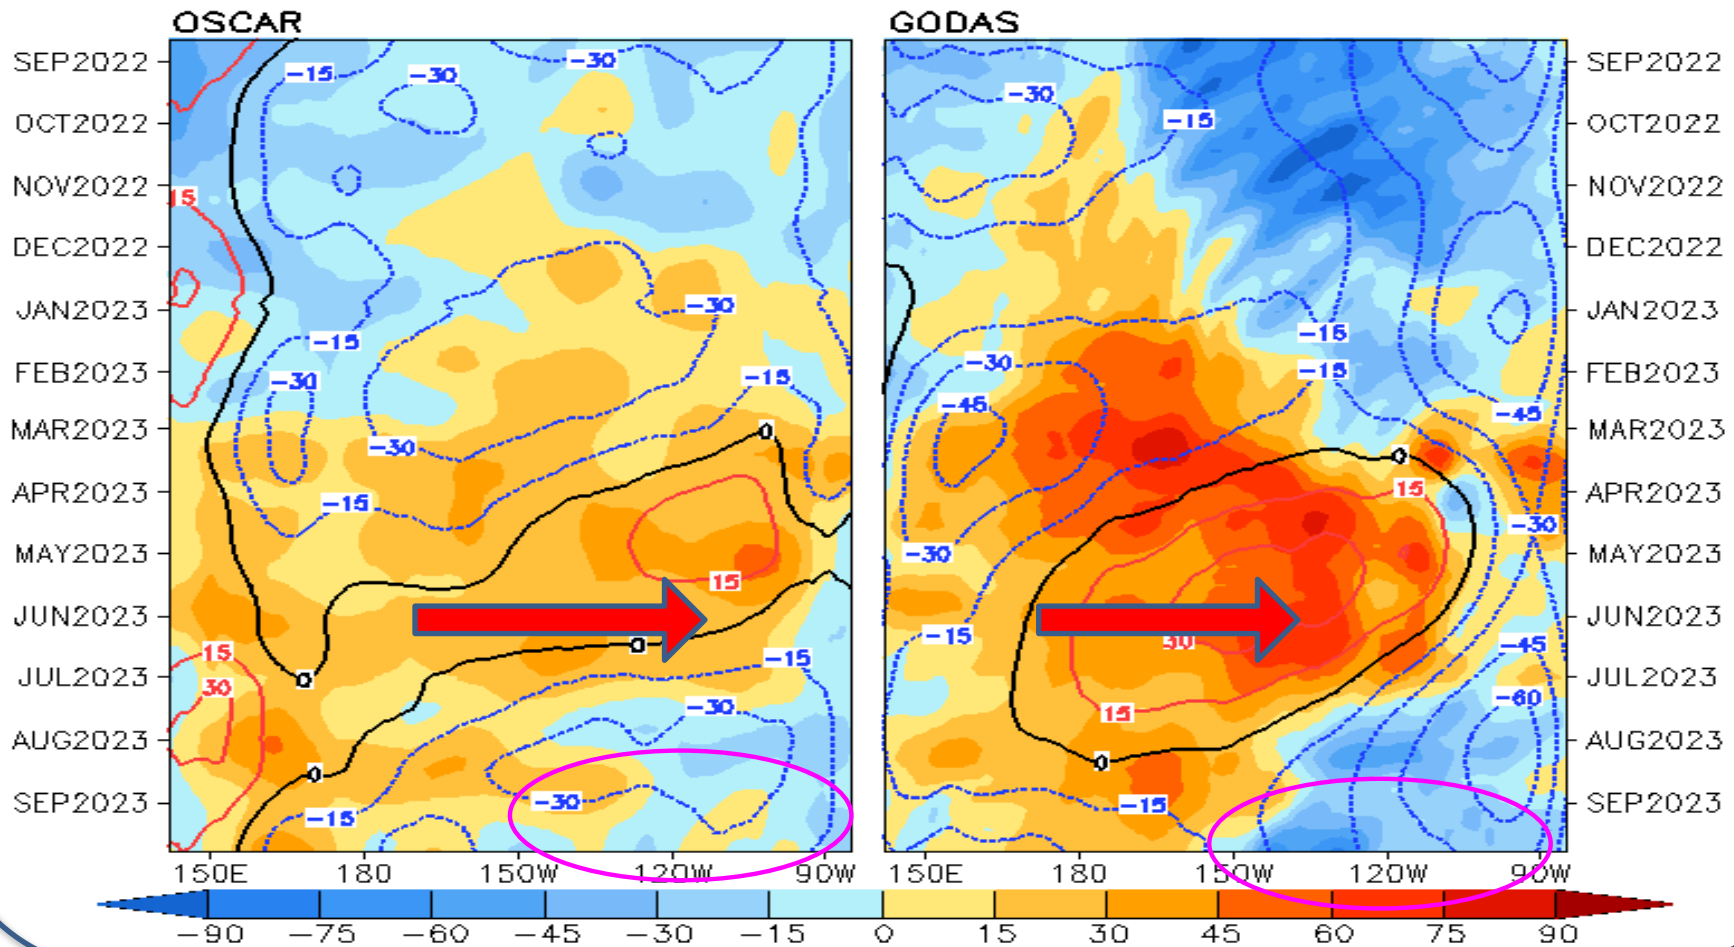

GODAS

- Strong subsurface temperatures persisted in the eastern Pacific.
- Negative temperature anomalies near dateline weakened in the end of Sep 2023.
- The features of the ocean temperature anomalies were similar between GODAS (model based) and TAO (objective) analysis.

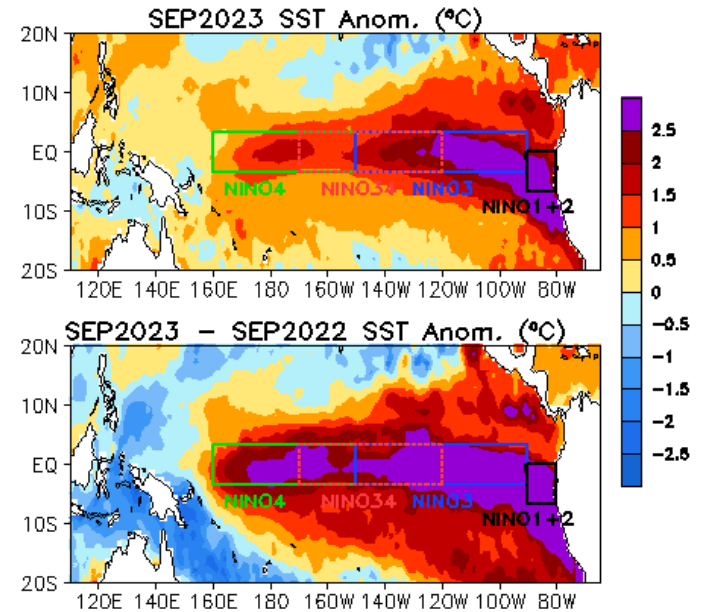

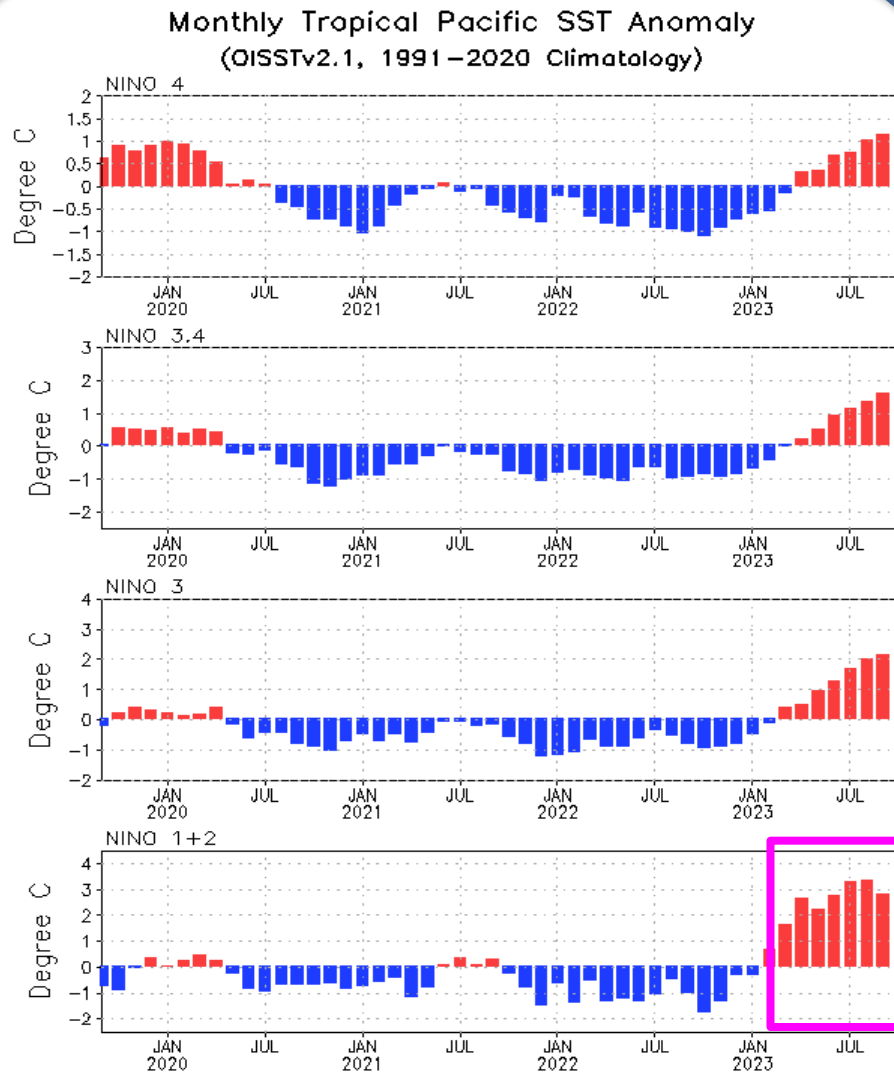

Evolution of Equatorial Pacific Surface Zonal Current Anomaly (cm/s)

U (15m), cm/s, 2°S–2°N (Shading=Anomaly; Contour=1993–2020 Clim)

- Anomalous eastward currents were present in the equatorial Pacific in both OSCAR and GODAS since Feb 2023, which were consistent with the growth of the positive SSTA.
- Anomalous westward currents enhanced east of 150W in Sep 2023.

Evolution of Pacific Niño SST Indices

- Except Niño1+2, Niño indices strengthened in Sep 2023, with Niño3.4 = 1.6°C.
- Positive Niño1+2 weakened in Sep 2023, with Niño1+2 = 2.8°C.
- Compared with Sep 2022, the tropical Pacific was much warmer in Sep 2023.
- The indices may have differences if based on different SST products.

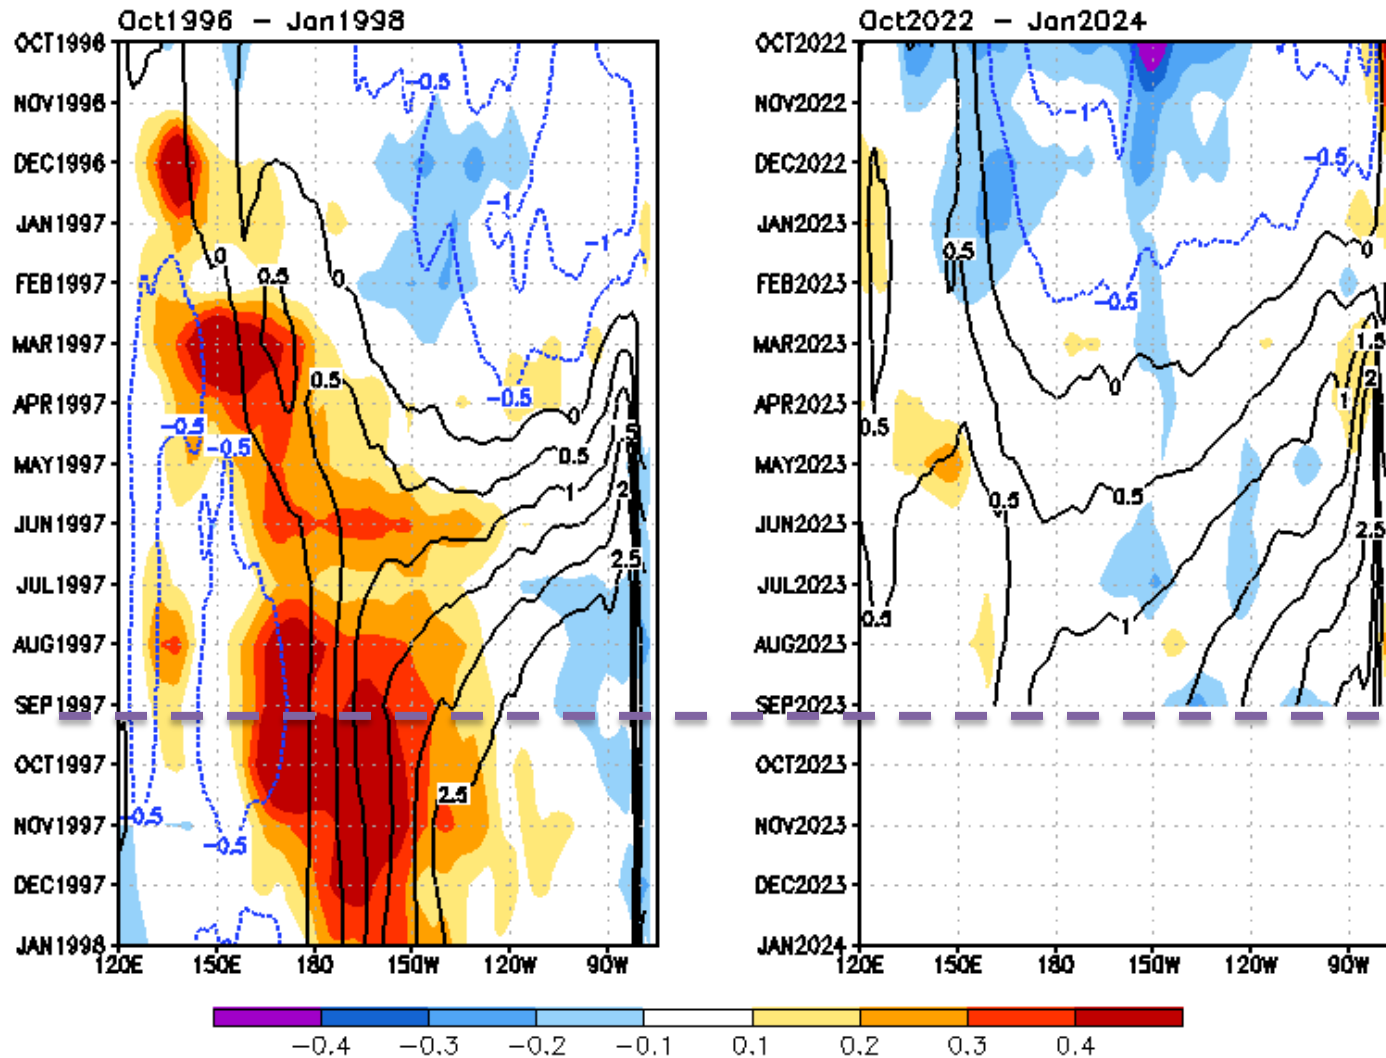

Niño region indices, calculated as the area-averaged monthly mean SSTAs (°C) for the specified region. Data are derived from the Olv2.1 SST analysis, and anomalies are departures from the 1991-2020 base period means.

Evolution of NINO34 & NINO1+2 in El Niño Years

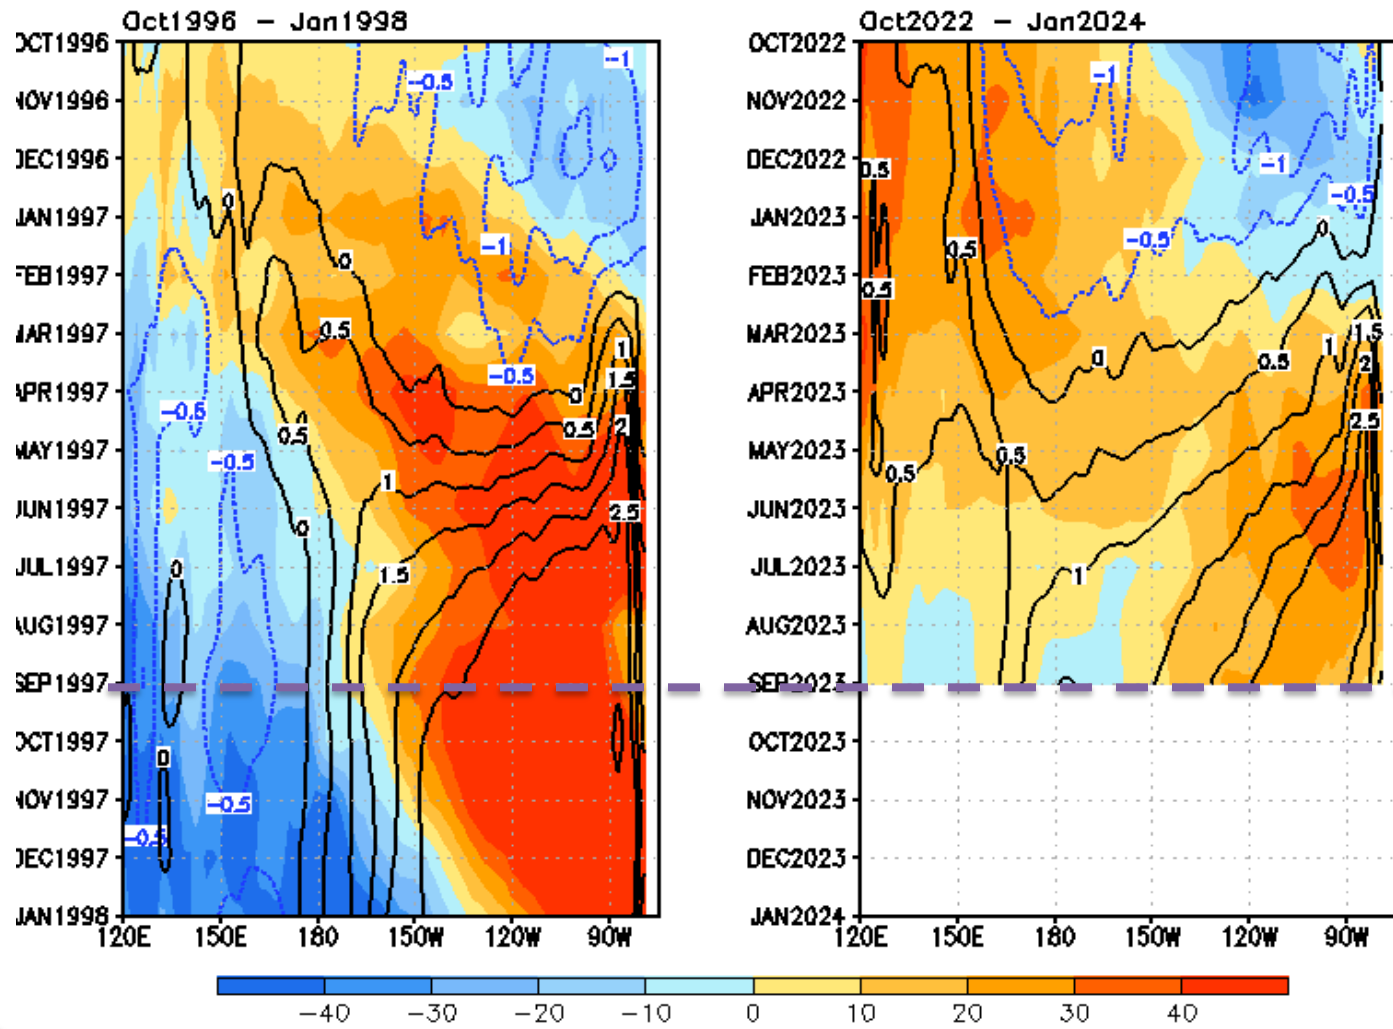

Evolution of Monthly Mean Zonal Wind Stress Anomaly across [5S-5N]

Monthly Mean TAUX(shaded) & SST(contour) Anomaly(5S-5N: 1991-2020 Climatology)

Evolution of Monthly Mean D20 Anomaly across [2S-2N]

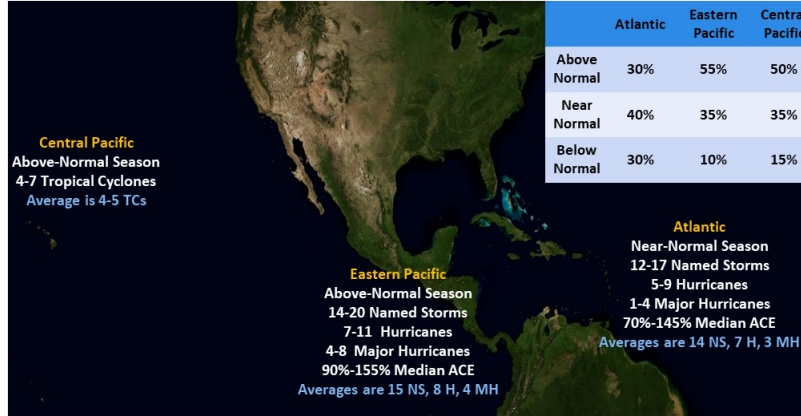

Monthly Mean D20(shaded) & SST(contour) Anomaly (2S-2N: 1991-2020 Climatology)

2023 Pacific Hurricane Season Activities

NOAA's 2023 Hurricane Season Outlooks

For the Eastern Pacific hurricane region, the outlooks indicate a 55% chance of an above-normal season, a 35% chance of a near-normal season, and a 10% chance of an above-normal season. The odds for the Central Pacific are 50% for an above-normal season, 35% for a near-normal season, and 15% for a below-normal season.

These outlooks are for the overall seasonal activity. They are not a hurricane landfall forecast.

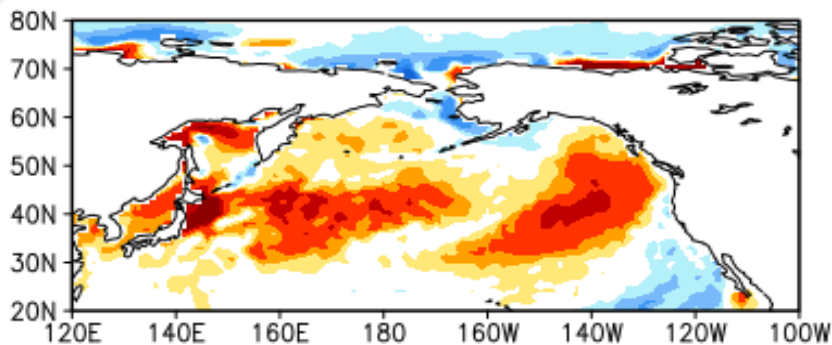

https://en.wikipedia.org/wiki/2023_Pacific_hurricane_season

E. Pacific	Observations (By Oct 9)	Outlook (May 25) 55% above-normal	(1991-2020)
Total storms	13	14-20	15
Hurricanes	8	7-11	8
Major hurricanes	5	4-8	4

North Pacific & Arctic Oceans

Last 3-month North Pacific SST, SLP, and uv925 anomalies

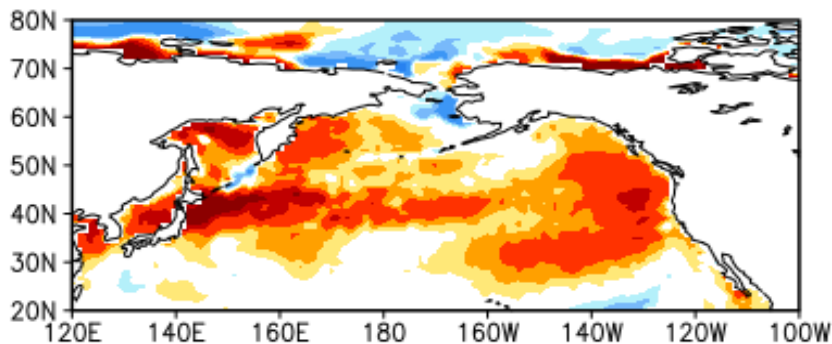

JUL 2023 SST Anom. (°C)

JUL 2023 SLP Anom.(hPa)
925hPa Wind Anom(m/s)

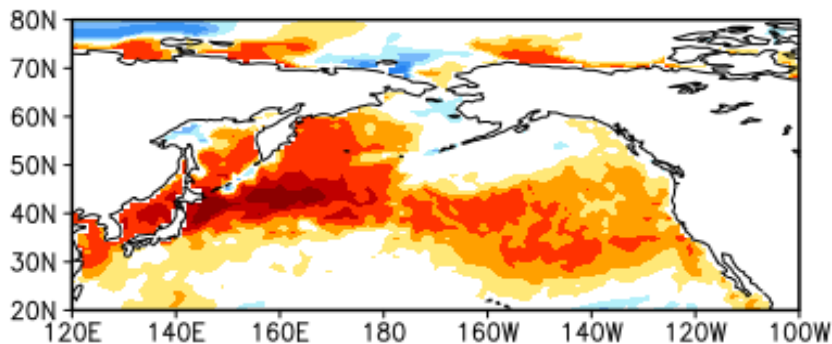

AUG 2023 SST Anom. (°C)

AUG 2023 SLP Anom.(hPa)
925hPa Wind Anom(m/s)

SEP 2023 SST Anom. (°C)

SEP 2023 SLP Anom.(hPa)
925hPa Wind Anom(m/s)

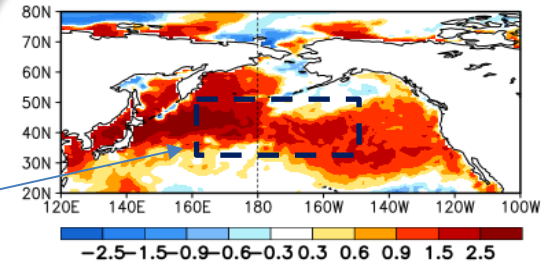

Subsurface Temperature Anomaly in the Northcentral Pacific

Anomalous Temperature (C) in [160E-150W, 30N-45N]

SEP 2023 SST Anom. (°C)

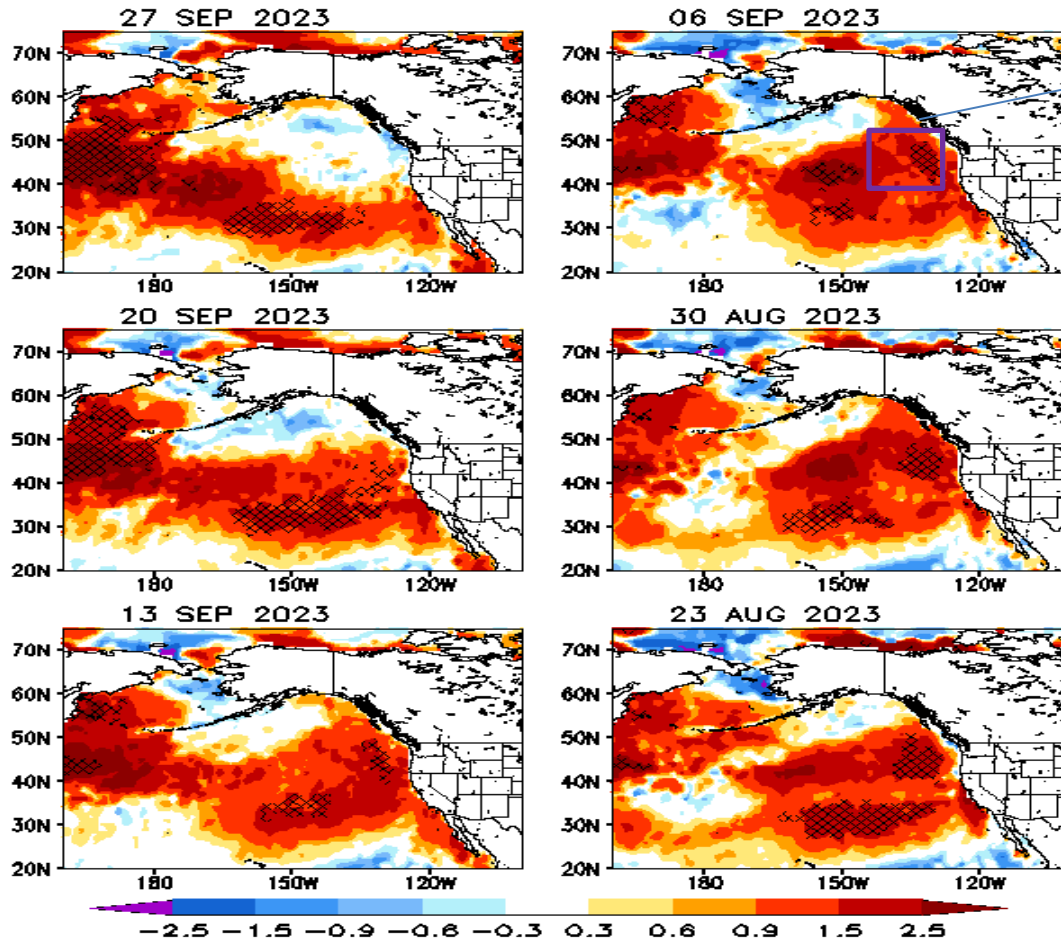

1st EOF of monthly ERSST v3b

- Positive temperature anomaly (>0.9°C) penetrated to 150m deep and persisted since 2020.
- Subsurface warming in the last three years is the strongest since 1979.

Weekly SST anomaly and MHWs in the North Pacific

Weekly OISSTv2.1 Anom. ($^{\circ}\text{C}$)
Hatch area: MHW location

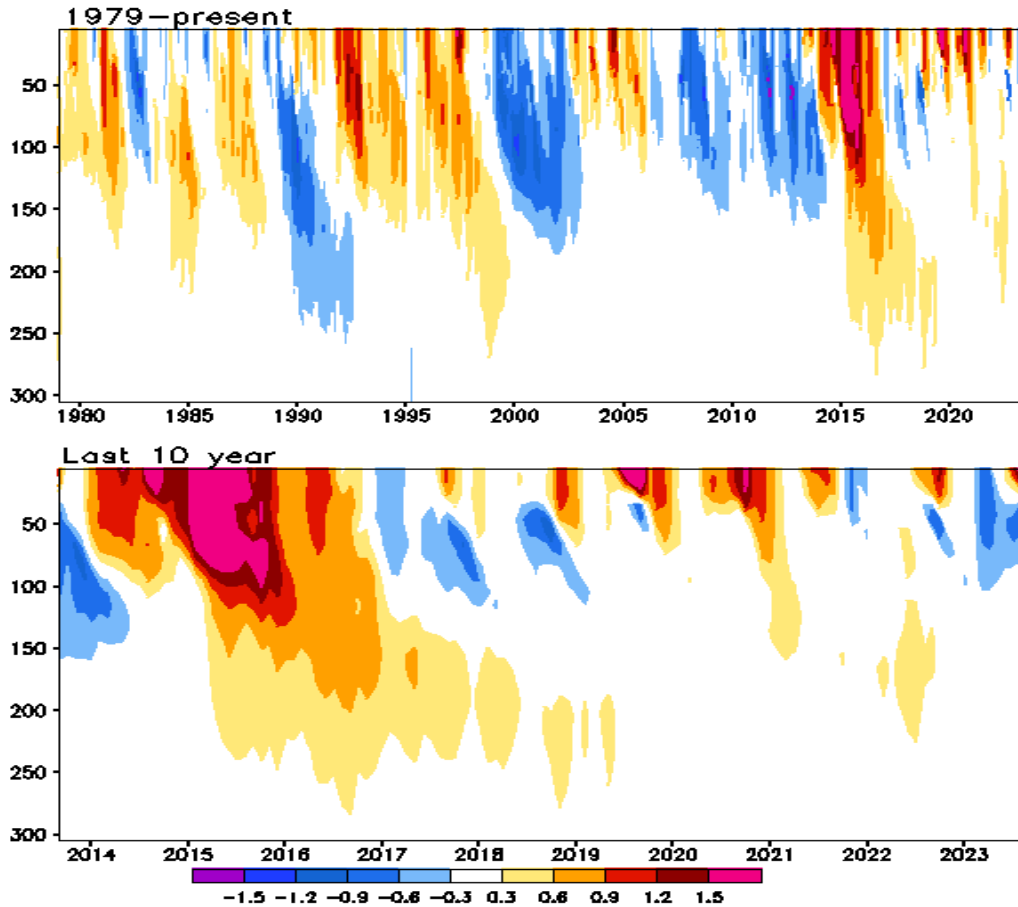

- MHW developed in the northwest of Pacific Ocean in Sep 2023.
- MHWs near the northwest coast of USA decayed in Sep 2023.
- Considerable amount of anomalously warm waters persisted near the coast of California.

(Left panel) Weekly SST anomaly (shaded) and locations experience Marine heat waves (hatched) by the date labelled in the plot. (right panel) SST evolution at a specific location. Green line and blue line denote the seasonal 90th percentile and daily climatology, respectively. Shaded area denotes the periods experiencing MHW. MHW is defined as a discrete prolonged warmer than 90th percentile of daily SST for at least 14 days. Data is derived from NCEI OISSTv2.1 and the climatology reference period is 1991-2020

Subsurface Temperature Anomaly in the Northeast Pacific

Anomalous Temperature (C) in [140W–125W, 35N–50N]

- Subsurface warm water was only confined in the upper 50m in Sep 2023.

Two Oceanic PDO indices

SST-based PDO (Wen et al. 2014: GRL)

H300-based PDO (Arun and Wen 2016: Mon. Wea. Rev.)

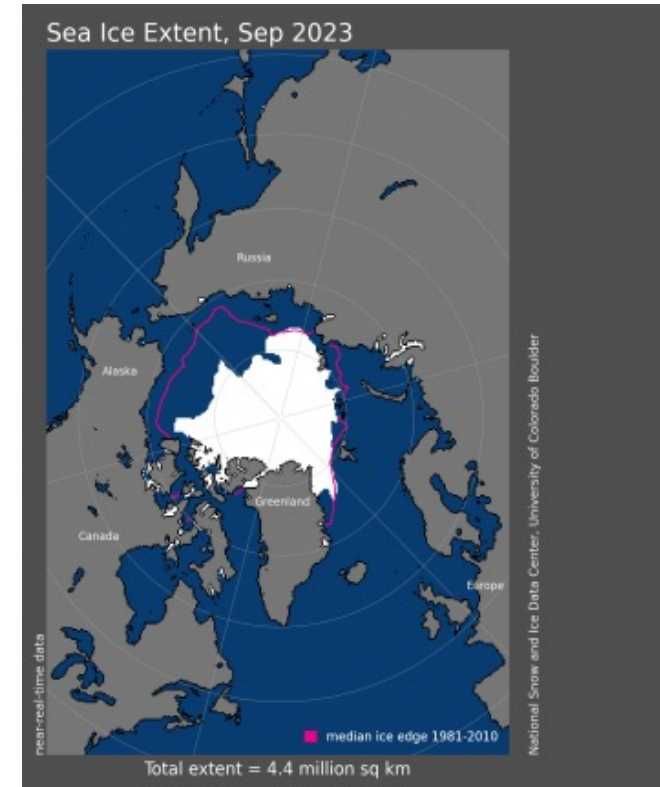

- The negative phase of PDO has persisted since Jan 2020 with PDOI = -2.1 in Sep 2023.

- Negative H300-based PDO index has persisted since Nov 2016, with HPDO = - 2.2 in Sep 2023.

- SST-based PDO index has considerable variability both on seasonal and decadal time scales.

- H300-based PDO index highlights the slower variability and encapsulates an integrated view of temperature variability in the upper ocean.

SST-based PDO is defined as the 1st EOF of monthly ERSST v3b in the North Pacific for the period 1900-1993. PDO index is the standardized projection of the monthly ERSSTv5 SST anomalies onto the 1st EOF pattern. H300-based Pacific Decadal Oscillation is defined as the projection of monthly mean H300 anomalies from NCEP GODAS onto their first EOF vector in the North Pacific. PDO indices are downloadable from https://www.cpc.ncep.noaa.gov/products/GODAS/ocean_briefing.shtml.

- Average Arctic sea ice extent during Sep 2023 was 4.37 million square kilometers, the fifth lowest Sep in the satellite record.

-Antarctic sea ice extent reached its annual maximum extent of 16.96 million square kilometers on Sep 10, hitting the lowest sea ice maximum in the satellite record.

UFS

Observation: 4.37 10⁶km²

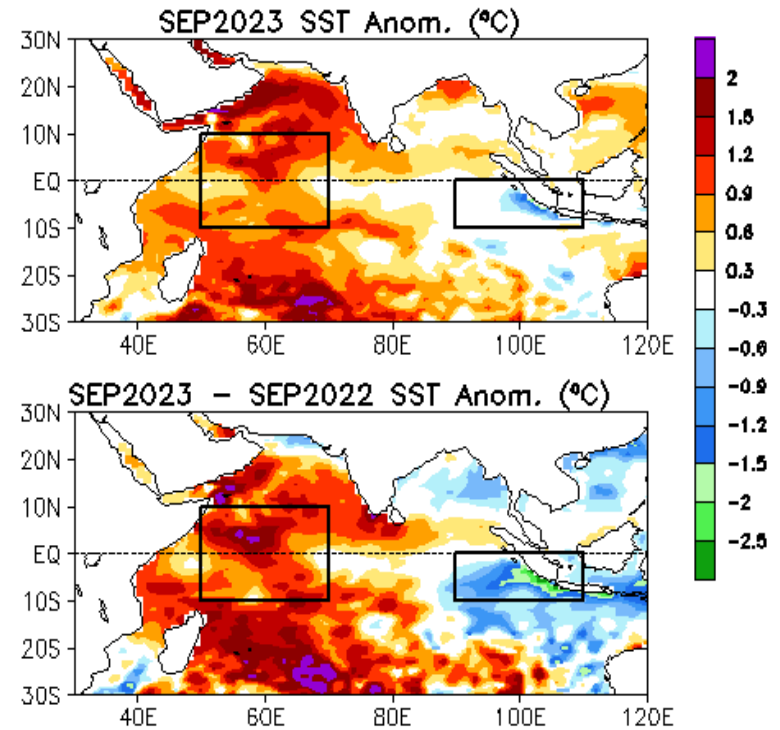

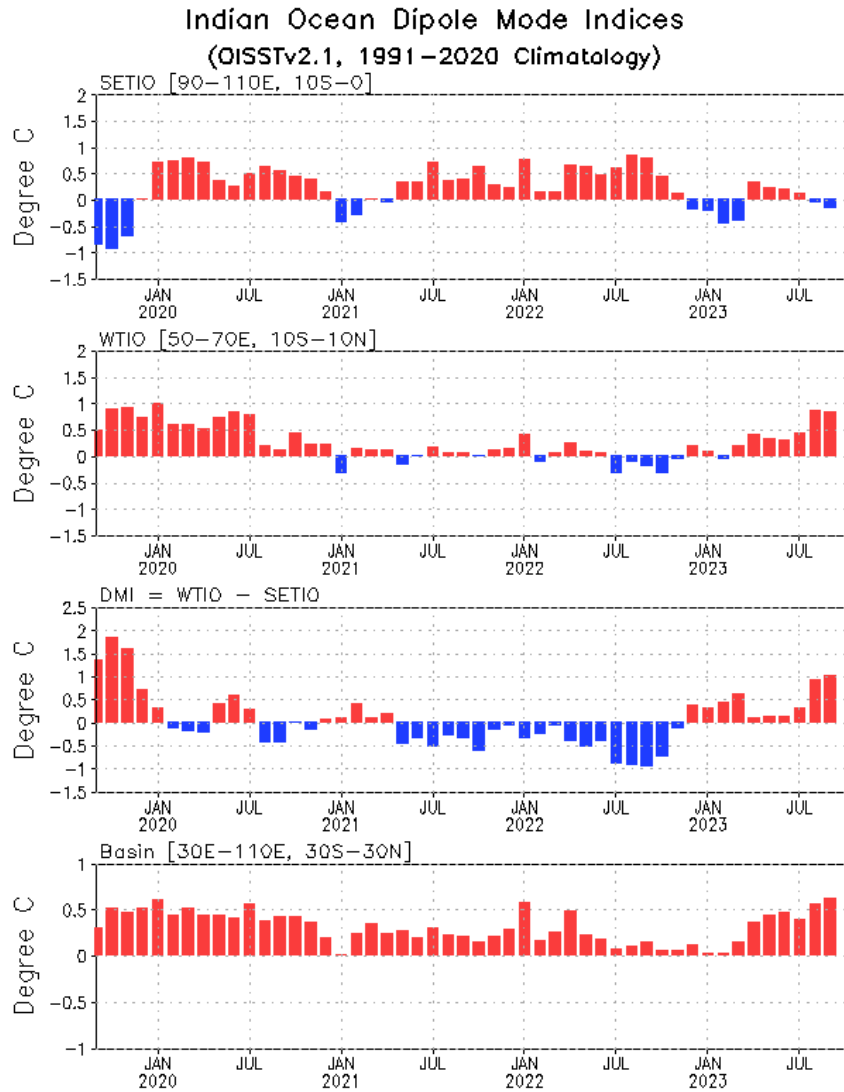

https://www.cpc.ncep.noaa.gov/products/people/jszhu/seaice_seasonal/index.html

- UFS forecasts suggest SIE will reach maximum around 14.7 million square kilometers in Mar 2024.

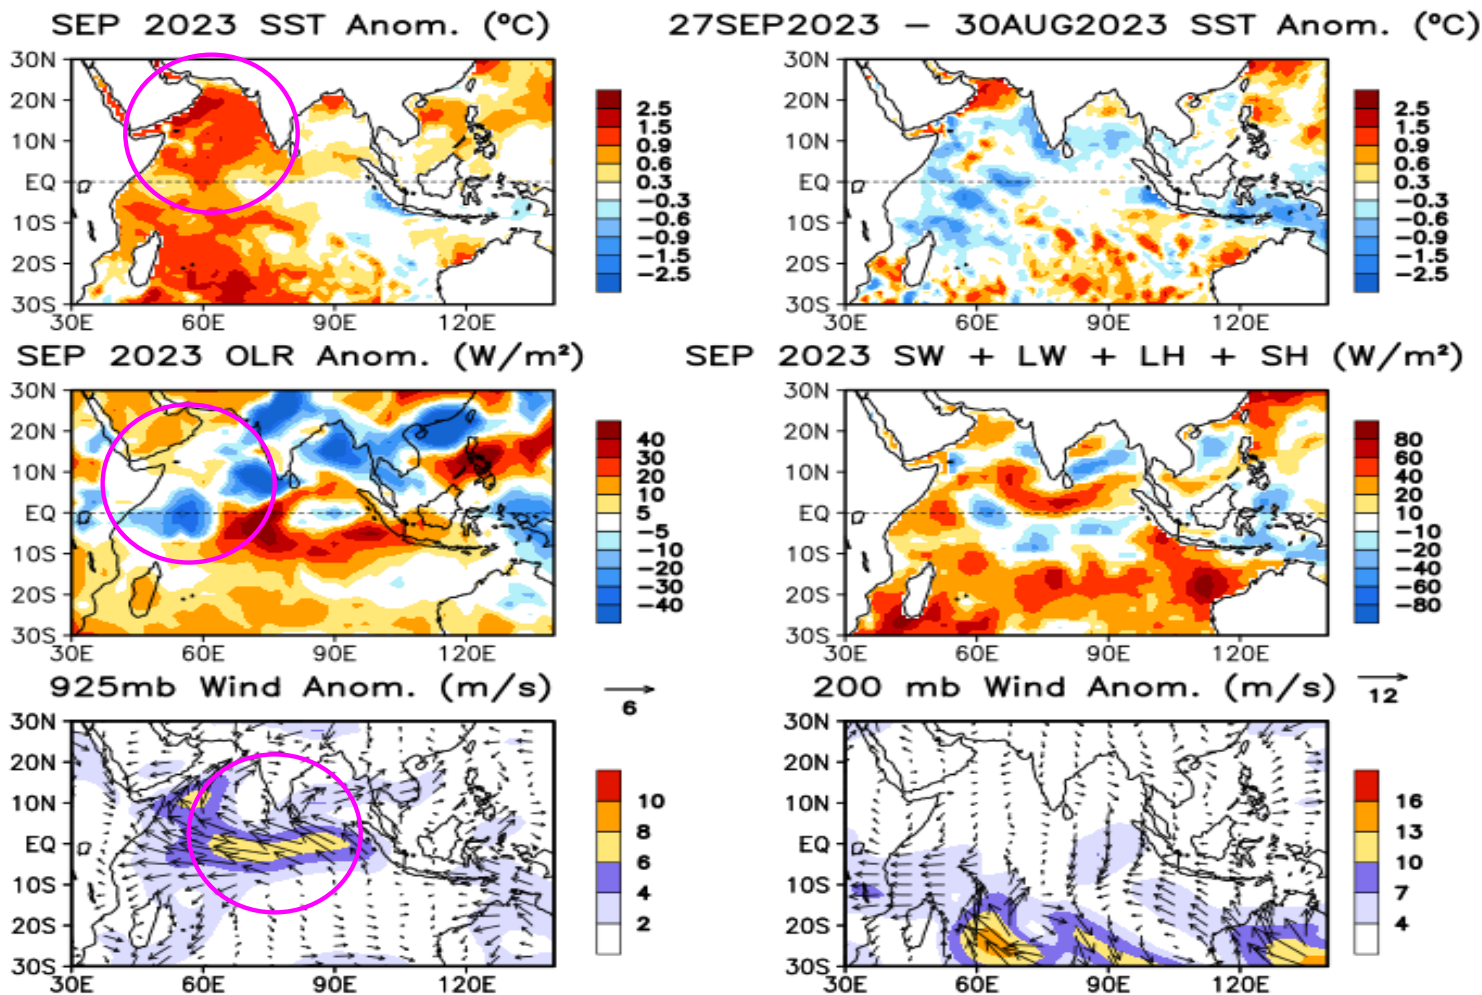

Indian Ocean

Evolution of Indian Ocean SST Indices

- Positive SSTAs dominated most of the tropical Indian Ocean basin in Sep 2023.
- Indian dipole mode index (DMI) has been greater than 0.4°C for a couple of months. It indicated a positive IOD event is underway.

Indian Ocean region indices, calculated as the area-averaged monthly mean SSTA (OC) for the SETIO [90°E–110°E, 10°S–0] and WTIO [50°E–70°E, 10°S–10°N] regions, and Dipole Mode Index, defined as differences between WTIO and SETIO. Data are derived from the OIv2.1 SST analysis, and anomalies are departures from the 1991–2020 base period means.

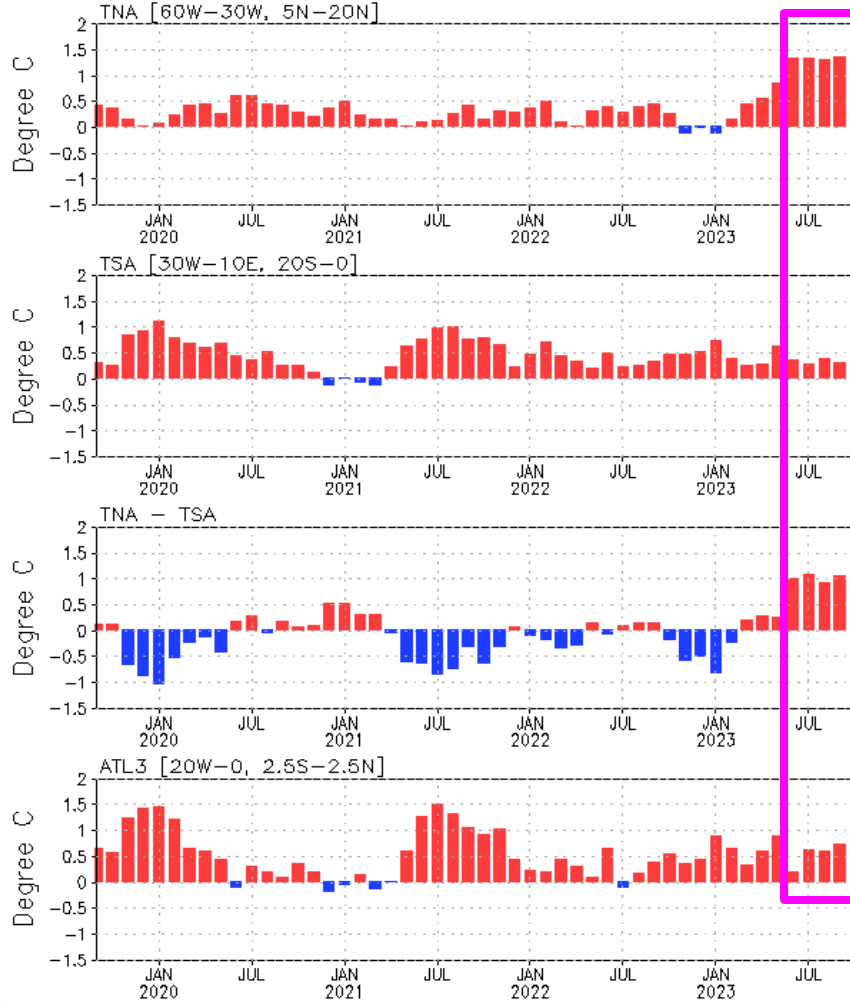

SSTAs (top-left), SSTA tendency (top-right), OLR anomalies (middle-left), sum of net surface short- and long-wave radiation, latent and sensible heat flux anomalies (middle-right), 925-mb wind anomaly vector and its amplitude (bottom-left), 200-mb wind anomaly vector and its amplitude (bottom-right). SST are derived from the Olv2.1 SST analysis, OLR from the NOAA 18 AVHRR IR window channel measurements by NESDIS, winds and surface radiation and heat fluxes from the NCEP CDAS. Anomalies are departures from the 1991-2020 base period means.

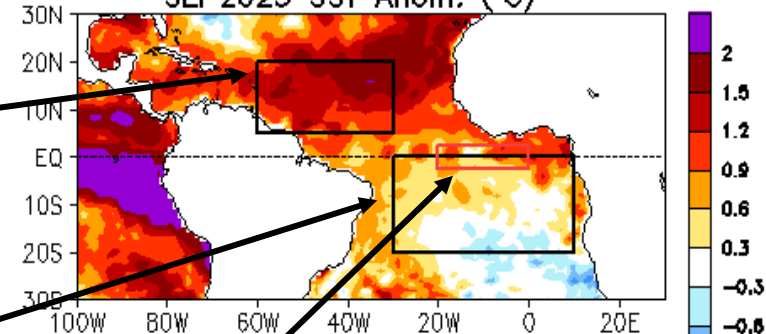

Tropical and North Atlantic Ocean

Evolution of Tropical Atlantic SST Indices

Monthly Tropical Atlantic SST Anomaly
(OISSTv2.1, 1991–2020 Climatology)

SEP2023 SST Anom. (°C)

SEP2023 – SEP2022 SST Anom. (°C)

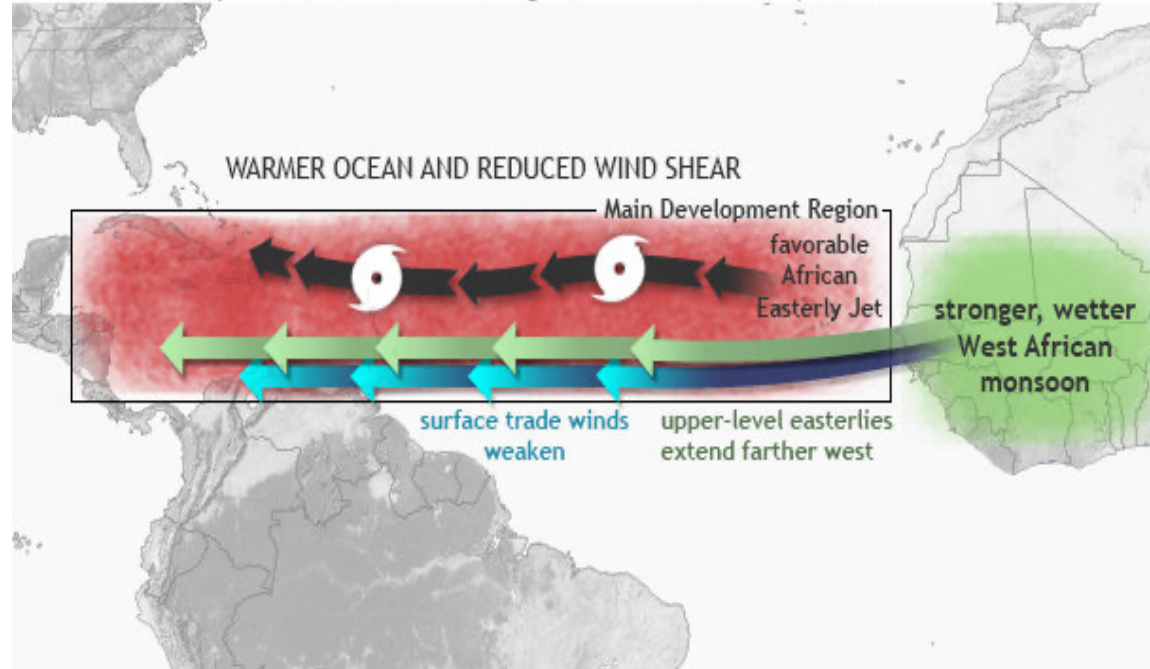

- Strong positive SSTA in the tropical north Atlantic persisted in Sep 2023, contributing to the large value of meridional mode index.
- Positive ATL3 index persisted in Sep 2023.

Tropical Atlantic Variability region indices, calculated as the area-averaged monthly mean SSTAs (°C) for the TNA [60°W–30°W, 5°N–20°N], TSA [30°W–10°E, 20°S–0] and ATL3 [20°W–0, 2.5°S–2.5°N] regions, and Meridional Gradient Index, defined as differences between TNA and TSA. Data are derived from the OIv2.1 SST analysis, and anomalies are departures from the 1991–2020 base period means.

Hurricane-friendly Climate Conditions

Hurricane-friendly climate conditions during “active” eras: warm phase of AMO

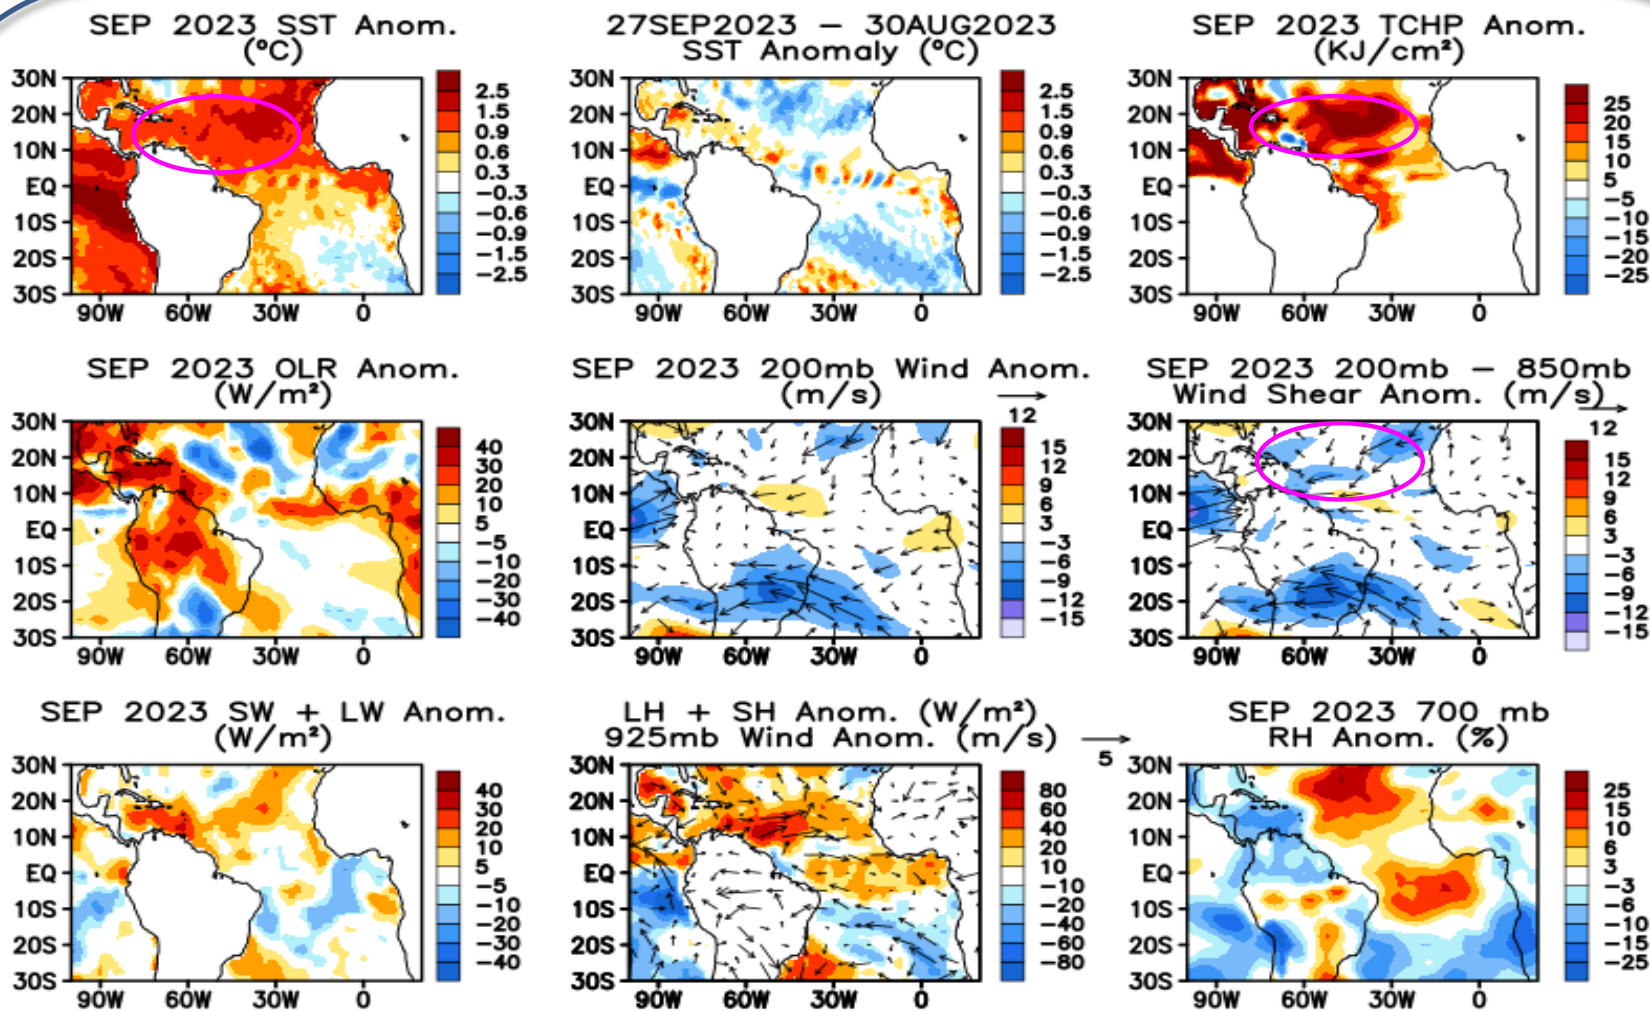

(Gerry Bell, 2014)

<https://www.climate.gov/news-features/blogs/enso/impacts-el-ni%C3%B1o-and-la-ni%C3%B1a-hurricane-season>

Established theories:

- Warm phase of Atlantic Multi-decadal Oscillation (AMO)
- Warmer SSTs across the Atlantic hurricane main development region
- Reduced wind shear (i.e ENSO impact)
- Stronger West African monsoon

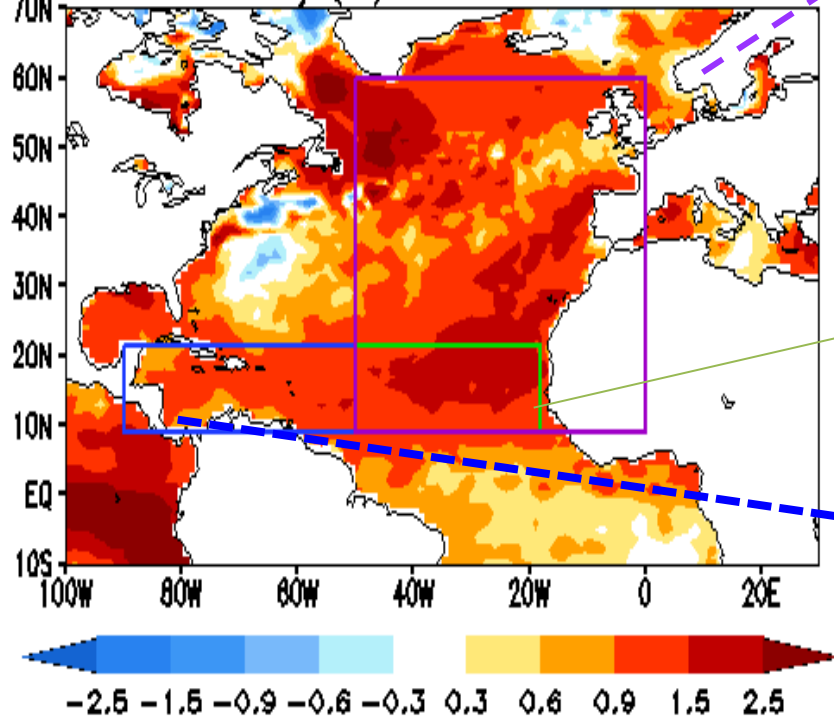

Tropical Atlantic: SST, SST tend., TCHP, OLR, 200 hPa wind, wind share, heat flex, & RH anom.

Top Row: SSTA (left; OI SST), SSTA tendency (central), Tropical Cyclone Heat Potential anomaly (right; GODAS).
 Middle row: OLR (left; NOAA 18 AVHRR IR), UV200 (central; NCEP CDAS), UV200-UV850 (right; NCEP CDAS) anomalies.
 Bottom row: SW+LW (left), LH+SH (central), Relative humidity at 700 hPa (right; NCEP CDAS) anomalies.
 Anomalies are departures from the 1991-2020 base period means.

Evolution of SST anomaly in the North Atlantic

OISSTv2.1 Anomaly (°C) : AUG-SEP 2023

Evolution of 200mb-850mb Wind Shear Anomaly

200mb - 850mb Wind Shear Anom. (m/s): AUG-SEP 2023

- Statistically, wind shear tends to enhance (weaken) over the Hurricane Main Development region (MDR, green box) during El Niño (La Niña) events.
- Negative wind shear anomalies dominated in the MDR during Aug-Sep 2023, favouring tropical storm development.

- NOAA forecasters have increased the likelihood of an above-normal Atlantic hurricane season from **30%** in outlook issued in May to **60%** in August outlook update.
- Main climate factors expected to influence the 2023 Atlantic hurricane activity are : the ongoing El Niño, the warm phase of the Atlantic Multi-Decadal Oscillation and record-warm Atlantic SSTs.
- **Likelihood of greater activity rises due to record-warm Atlantic SST .**
(<https://www.noaa.gov/news-release/noaa-forecasters-increase-atlantic-hurricane-season-prediction-to-above-normal>)

2023 Atlantic Hurricane Season Activities

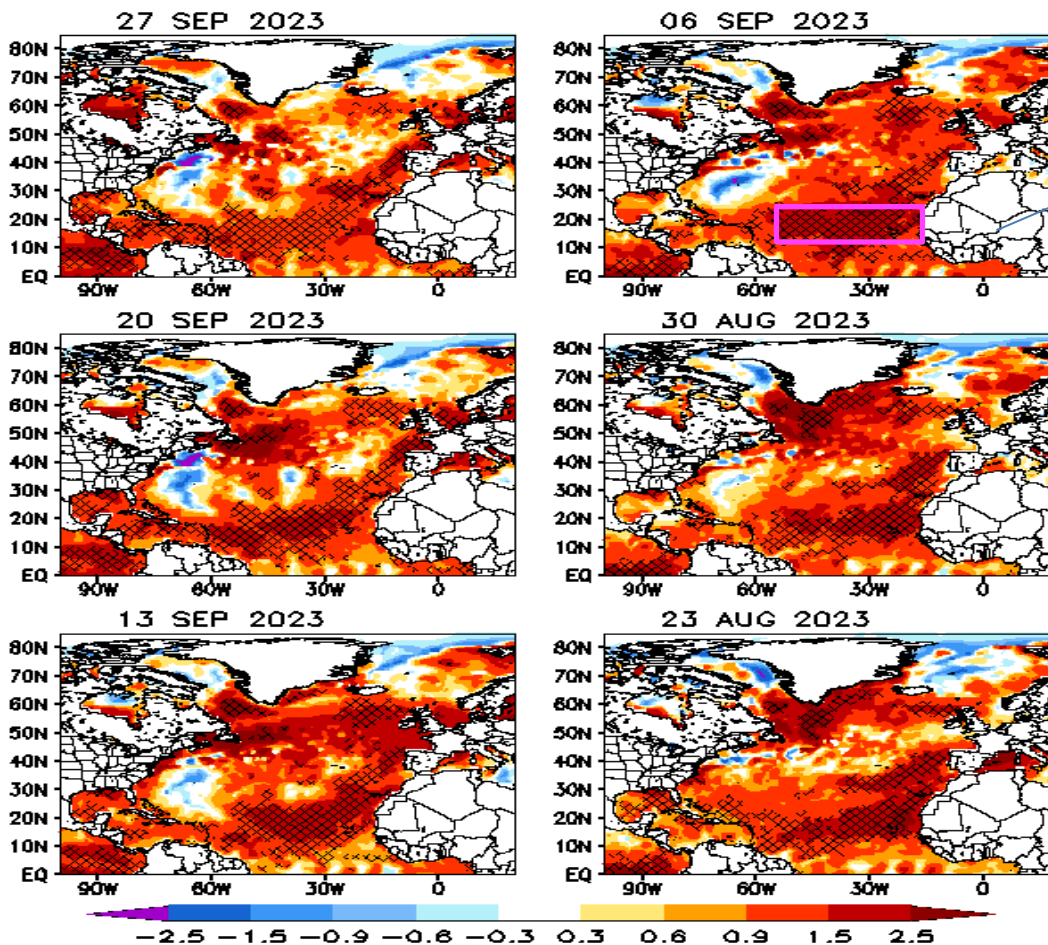

https://en.wikipedia.org/wiki/2023_Atlantic_hurricane_season

- By 9 Oct 2023, eighteen tropical storms formed, with six developing into hurricane and three major hurricanes.

Atlantic	Observations (By Oct 9)	Updated Outlook (Aug) 60% above-normal	Outlook (May 25) 40% near-normal	(1991-2020)
Total storms	18	14-21	12-17	14
Hurricanes	6	6-11	5-9	7
Major hurricanes	3	2-5	1-4	3

Weekly SST anomaly and MHWs in the North Atlantic

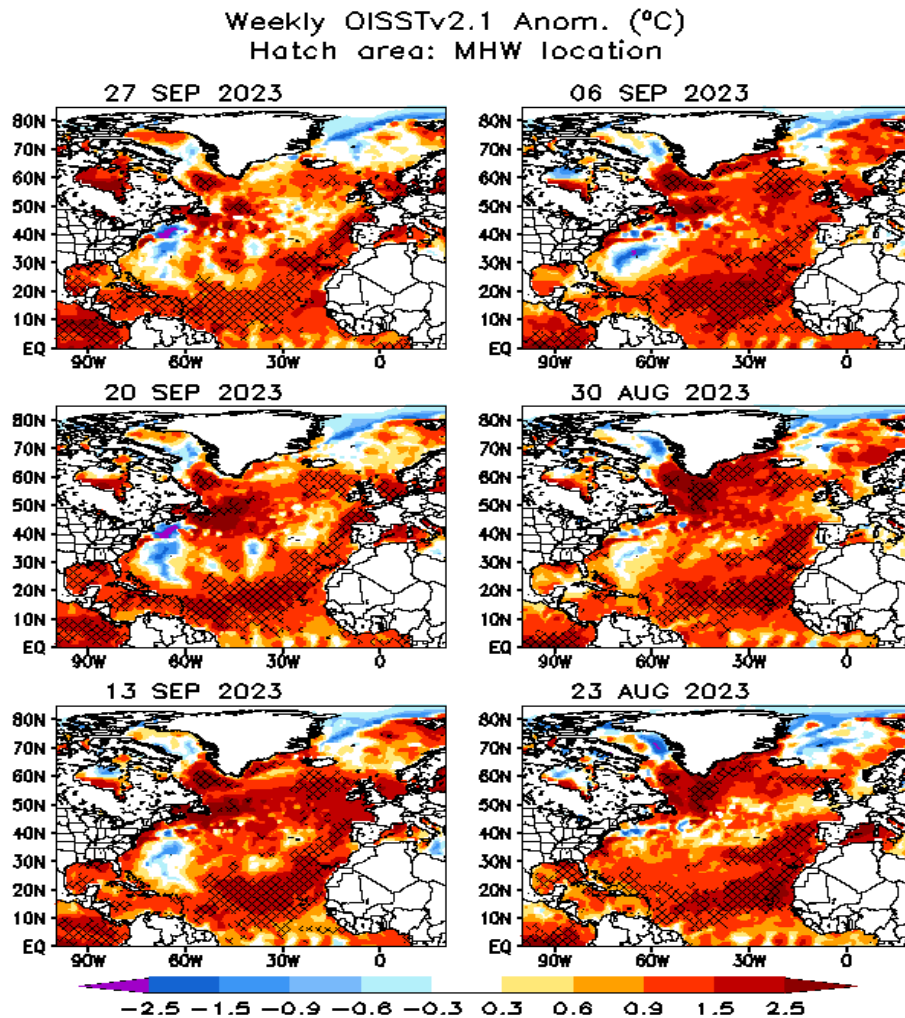

Weekly OISSTv2.1 Anom. (°C)
Hatch area: MHW location

- Strong MHWs continued near the west coast of North Africa.
- MHWs near the Caribbean, Gulf of Mexico weakened in early Sep and reemerged in late Sep 2023.
- MHWs continued near the Labrador basin.

(Left panel) Weekly SST anomaly (shaded) and locations experience Marine heat waves (hatched) by the date labelled in the plot. (right panel) SST evolution at a specific location. Green line and blue line denote the seasonal 90th percentile and daily climatology, respectively. Shaded area denotes the periods experiencing MHW. MHW is defined as a discrete prolonged warmer than 90th percentile of daily SST for at least 14 days. Data is derived from NCEI OISSTv2.1 and the climatology reference period is 1991-2020

Connection between MHWs and Hurricanes

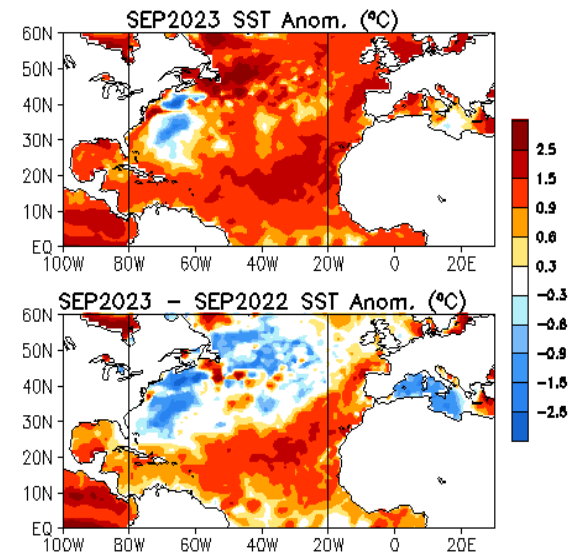

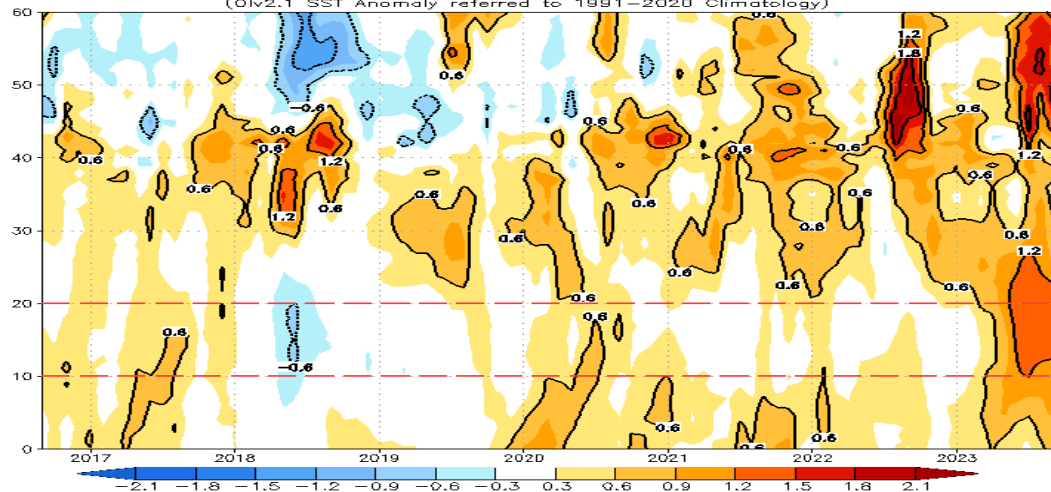

(Left panel) Weekly SST anomaly (shaded) and locations experience Marine heat waves (hatched) by the date labelled in the plot. (right panel) SST evolution at a specific location. Green line and blue line denote the seasonal 90th percentile and daily climatology, respectively. Shaded area denotes the periods experiencing MHW. MHW is defined as a discrete prolonged warmer than 90th percentile of daily SST for at least 14 days. Data is derived from NCEI OISSTv2.1 and the climatology reference period is 1991-2020

NAO and SST Anomaly in North Atlantic

Monthly Standardized NAO

Zonal Averaged Monthly SSTA in North Atlantic (80W-20W, C)
(Div2.1 SST Anomaly referred to 1991-2020 Climatology)

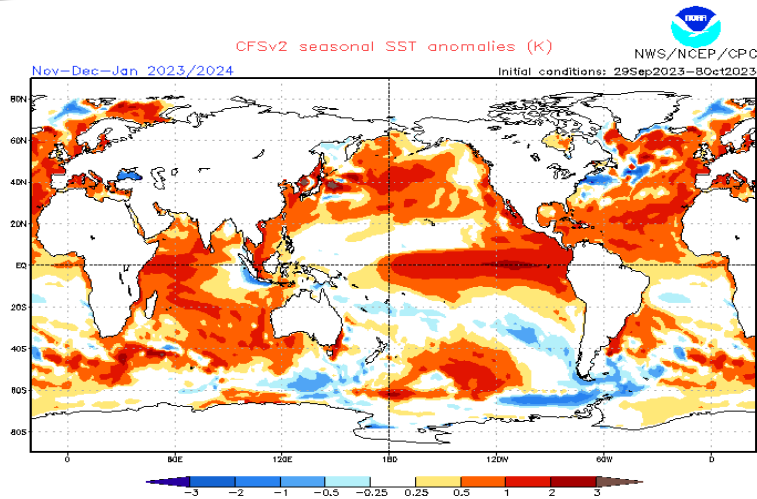

- Negative NAO weakened to near normal in Sep 2023.
- Strong warming continued in the eastern North Atlantic Ocean.
- The prolonged positive SSTAs in the middle latitudes were evident, due to dominance of the positive phase of NAO during the last 5-6 years.

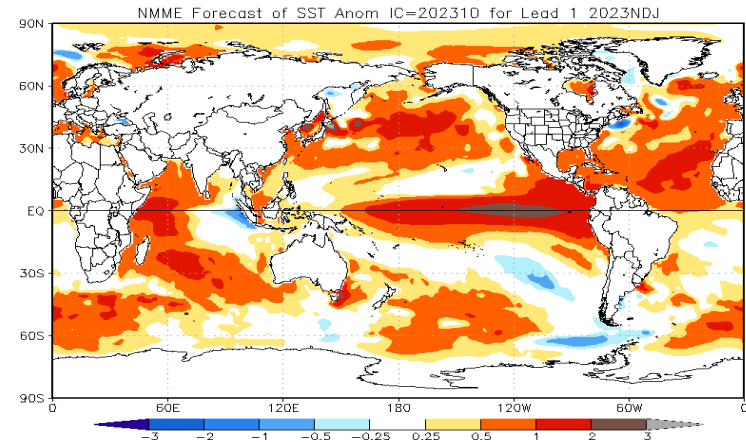

Monthly standardized NAO index (top) derived from monthly standardized 500-mb height anomalies obtained from the NCEP CDAS in 20°N-90°N. Time-latitude section of SSTAs averaged between 80°W and 20°W (bottom). SST are derived from the Div2.1 SST analysis, and anomalies are departures from the 1991-2020 base period means.

ENSO and Global SST Predictions

CFSv2 IC:Oct for NDJ 2023

NMME IC:Oct for NDJ

NWS/NCEP/CPC

Last update: Thu Oct 5 2023
 Initial conditions: 29Sep2023-4Oct2023

CFSv2 forecast Nino3.4 SST anomalies (K)

NMME Nino3.4 Fcst, IC=202310

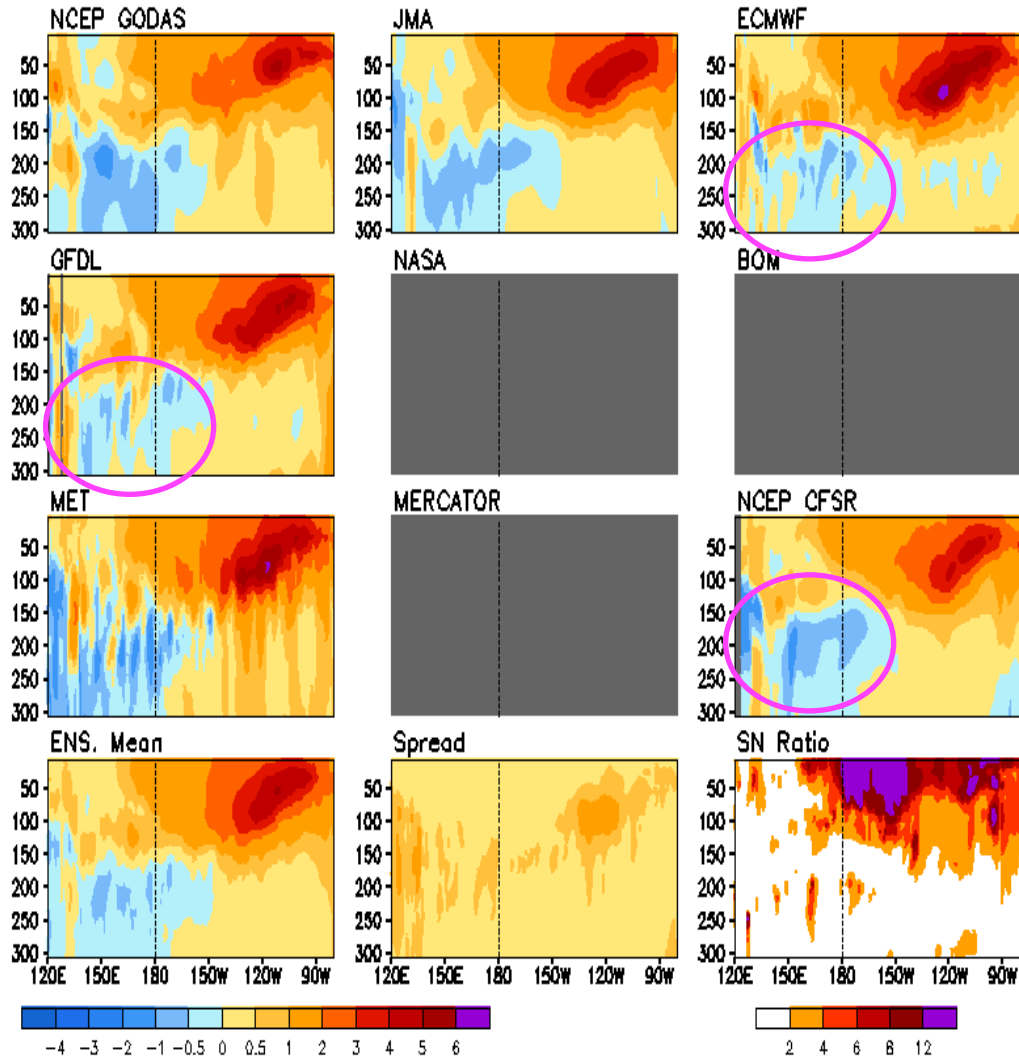

<https://www.cpc.ncep.noaa.gov/products/CFSv2/CFSv2seasonal.shtml>

<https://www.cpc.ncep.noaa.gov/products/NMME/>

Uncertainty in ocean initial conditions and NMME forecasts

Anomalous Temperature (C) Averaged in 1S-1N: SEP 2023

NMME forecasts from different initial conditions

IRI/CPC Niño3.4 Forecast

- Most of models forecasted that El Niño conditions will continue through the Northern Hemisphere winter 2023-24.
- Dynamical model ensemble mean favors of a strong El Niño in the coming winter.
- **ENSO Alert System Status issued on 14 Sep 2023: El Niño Advisory**
- Synopsis: "El Niño is anticipated to continue through the Northern Hemisphere winter (with greater than 95% chance through January - March 2024)"

Individual Model Forecasts: A strong El Niño in 2023

EC: Niño3.4, IC= 1 Oct 2023

UKMO: Niño3.4, Updated 11 Sep 2023

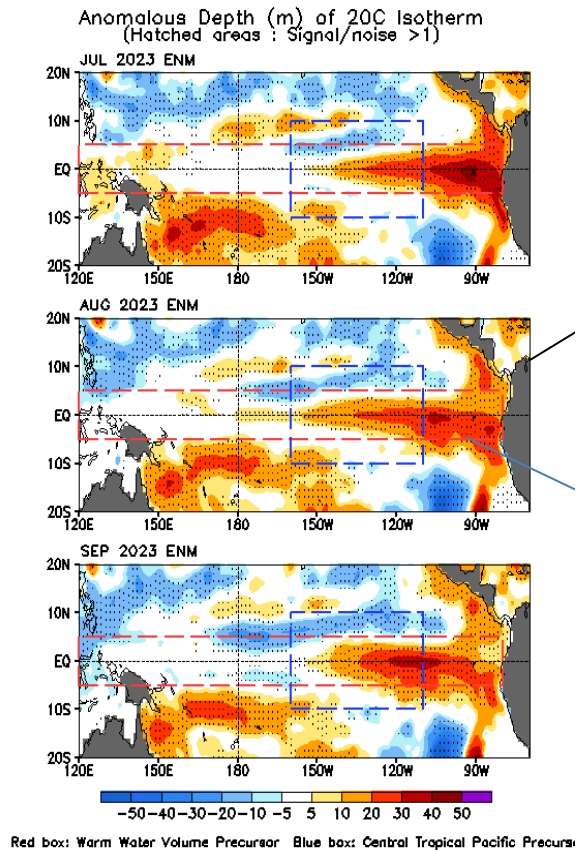

BOM: Niño3.4, Updated 7 Oct 2023

JMA: Niño3.4, Updated 11 Sep 2023

Oceanic ENSO Precursors: WWV & CTP

Warm water volume (WWV) is defined as an average of D20 anomaly across the equatorial Pacific (120° E – 80° W, 5° S-5° N) (Meinen and McPhaden 2000). Central tropical Pacific (CTP) index is calculated as the averaged D20 anomaly in the central tropical Pacific (160° W-110° W, 10° S-10° N) (Wen et al. 2014). The monthly D20 data is obtained from the Real-time Ocean Reanalysis Intercomparison Project (https://www.cpc.ncep.noaa.gov/products/GODAS/multiora93_body.html).

NMME Forecasts in the Indian Ocean

NMME Sea Surface Temperature Anomalies (DecC)
Nov2023–Jan2024
October2023 initial conditions

https://www.cpc.ncep.noaa.gov/products/international/ocean_monitoring/IO_monitoring_fcsts/io_index.shtml

NMME IOD fcst, IC=202310

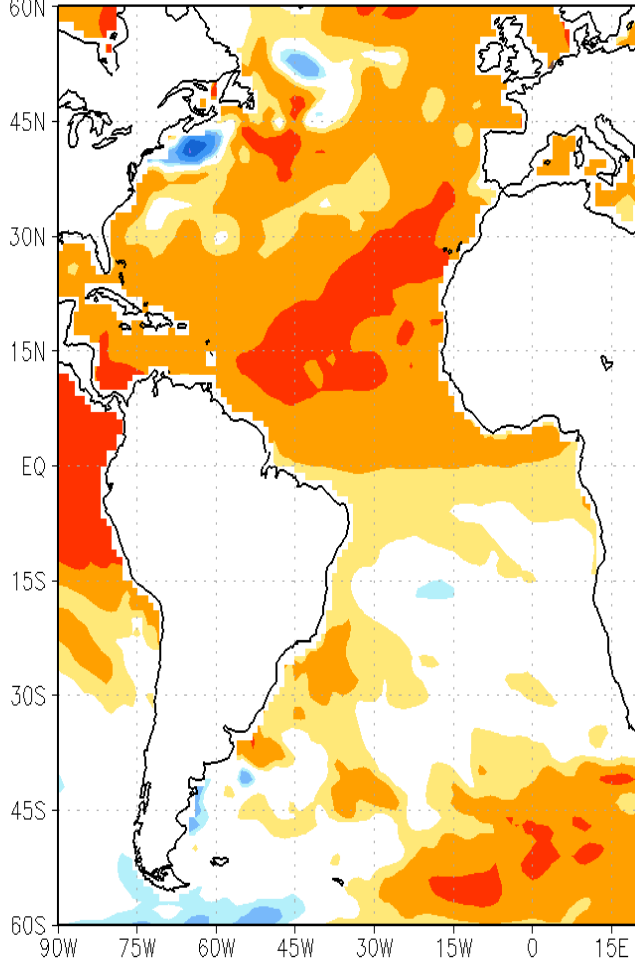

- All NMME members predict a positive IOD event will reach peak in Oct and last through winter 2023.

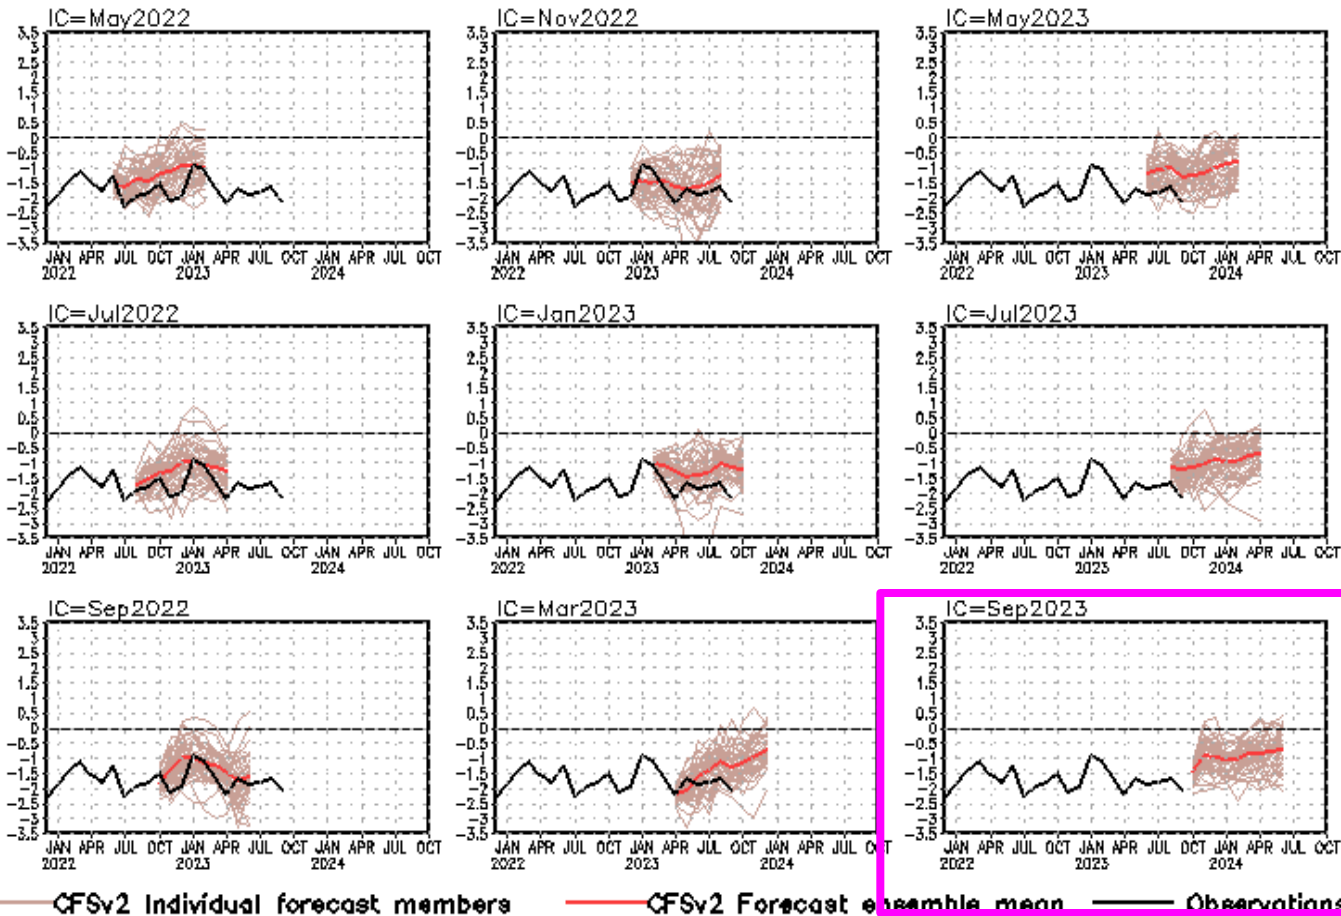

NMME Forecasts in the Atlantic Ocean

NMME Sea Surface Temperature Anomalies (DecC)

Nov2023-Jan2024 October2023 initial conditions

standardized PDO index

- CFSv2 predicts the negative phase of PDO will continue through spring 2024.

CFS Pacific Decadal Oscillation (PDO) index predictions from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). Anomalies were computed with respect to the 1991-2020 base period means. PDO is the first EOF of monthly ERSSTv3b anomaly in the region of [110°E-100°W, 20°N-60°N]. CFS PDO index is the standardized projection of CFS SST forecast anomalies onto the PDO EOF pattern.

NOAA PSL Marine Heat Wave Forecasts

- NMME forecasts suggest that MHW coverage will remain elevated near 35% of the global oceans through the end of 2023.
- MHW conditions are expected to persist in the eastern tropical Pacific, central North Pacific, Northwest Pacific near Japan and tropical North Atlantic through the end of year.
- MHW condition will persist in the Caribbean Sea and southern Gulf of Mexico through the end of 2023.

Backup Slides

Global Sea Surface Salinity (SSS): Anomaly for September 2023

New Update: The NCEI SST data used in the quality control procedure has been updated to version 2.1 since May 2020;

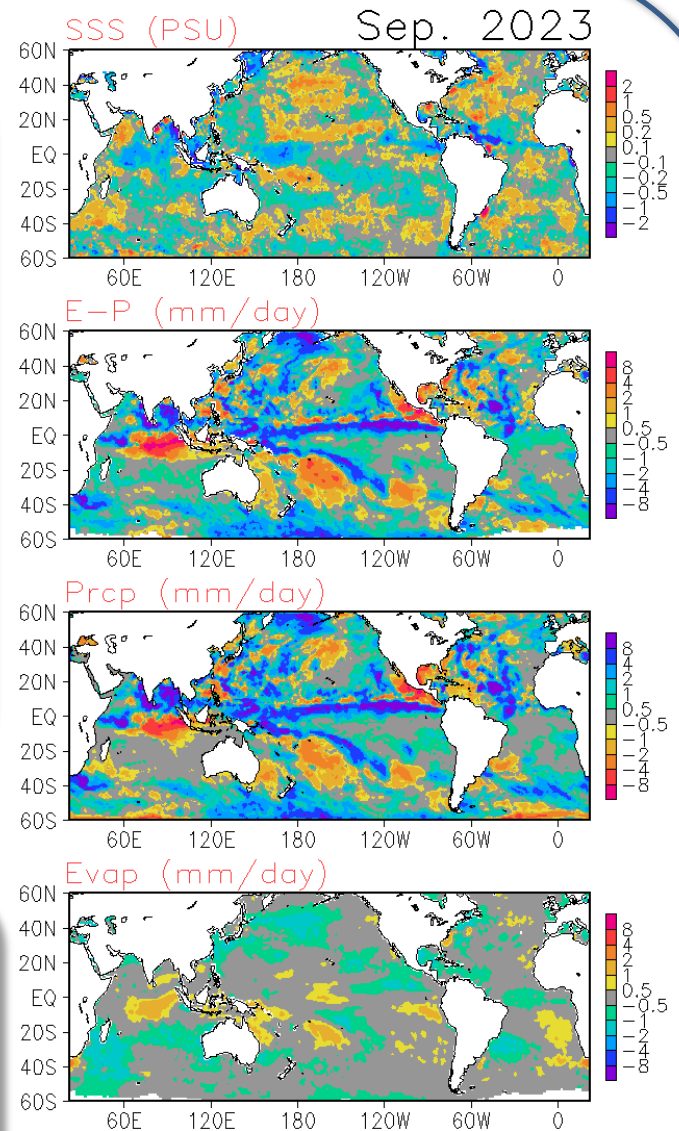

Enhanced fresh water flux, driven by strong precipitation, is observed across the equatorial Pacific, positioned slightly south of its climatological latitudes, causing freshened SSS anomalies there. Negative SSS anomalies also appear over the equatorial Atlantic and the Bay of Bengal, largely attributable to the positive precipitation over the regions. Saltier SSS anomalies, meanwhile, are present over the central northern Pacific and over the western southern Pacific east of Australia over regions of reduced ocean-going fresh water flux.

**SSS : Blended Analysis of Surface Salinity (BASS) V0.Z
(a CPC-NESDIS/NODC-NESDIS/STAR joint effort)**

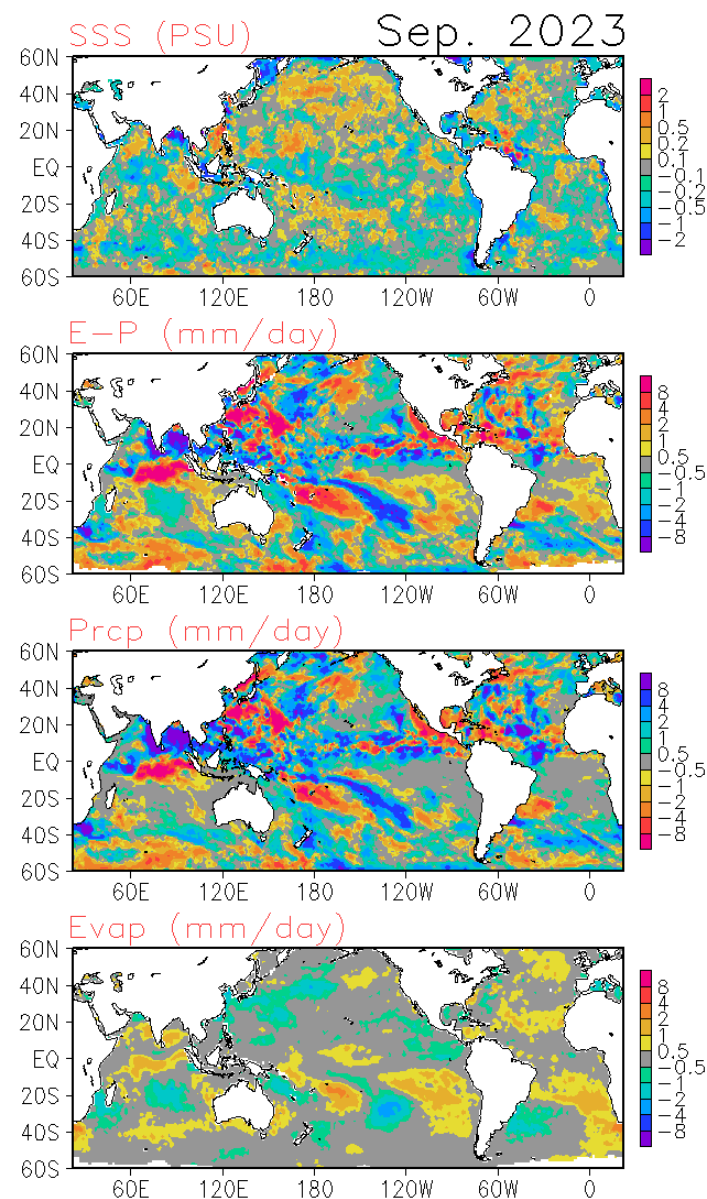

<ftp.cpc.ncep.noaa.gov/precip/BASS>

Precipitation: CMORPH adjusted satellite precipitation estimates

Evaporation: Adjusted CFS Reanalysis

Fresh water flux (E-P) exhibits an enhanced tendency across the equatorial Pacific slightly south of normal ITCZ positions, creating a freshened SSS tendency over the region. Negative (freshened) SSS tendency is also observed over the Bay of Bengal in consistent with the E-P tendency there. Also noticeable is the saltier SSS tendency offshore of the norther coast of Brazil, likely caused by the drier precipitation tendency there.

Monthly SSS Anomaly Evolution over Equatorial Pacific

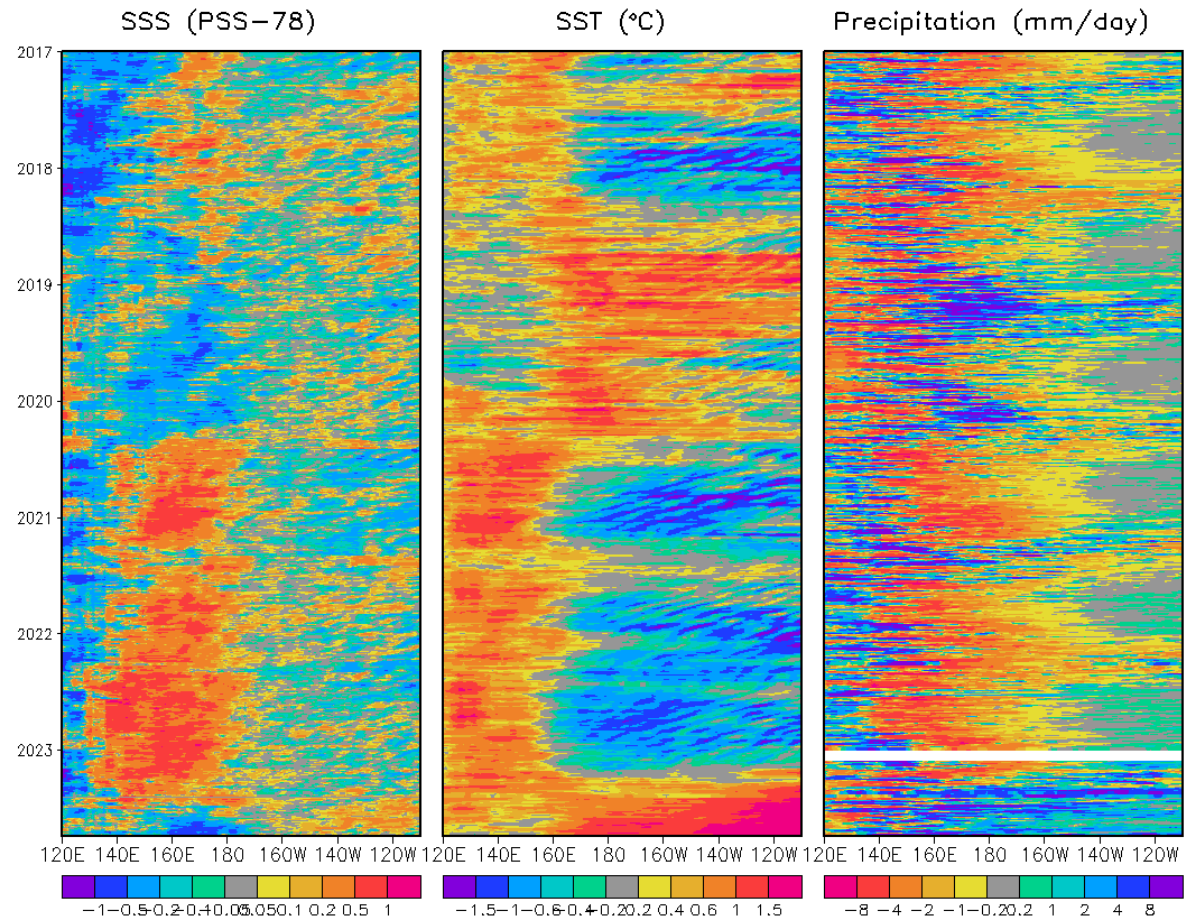

NOTE: Since June 2015, the BASS SSS is from in situ, SMOS and SMAP; before June 2015, The BASS SSS is from in situ, SMOS and Aquarius.

- Hovermoller diagram for equatorial SSS anomaly ($5^{\circ}\text{S}-5^{\circ}\text{N}$);
- Freshened SSS anomalies over the western and central equatorial Pacific ($130^{\circ}\text{E}-180^{\circ}$) are further enhanced as a result of the strong ITCZ activities during September 2023. Saltier SSS anomalies over the eastern equatorial Pacific is weakening and started to turn into negative as shown in the pentad figure on next slide.

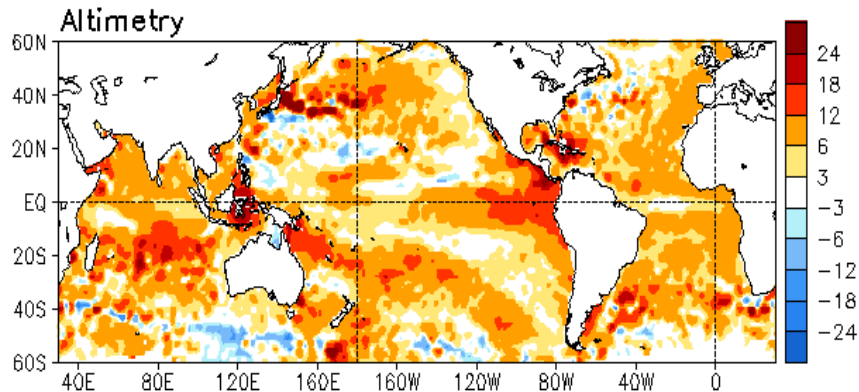

Pentad SSS Anomaly Evolution over Equatorial Pacific

Figure caption: Hovermoller diagram for equatorial (5°S - 5°N) 5-day mean SSS, SST and precipitation anomalies. The climatology for SSS is Levitus 1994 climatology. The SST data used here is the OISST V2 AVHRR only daily dataset with its climatology being calculated from 1985 to 2010. The precipitation data used here is the adjusted CMORPH dataset with its climatology being calculated from 1999 to 2013.

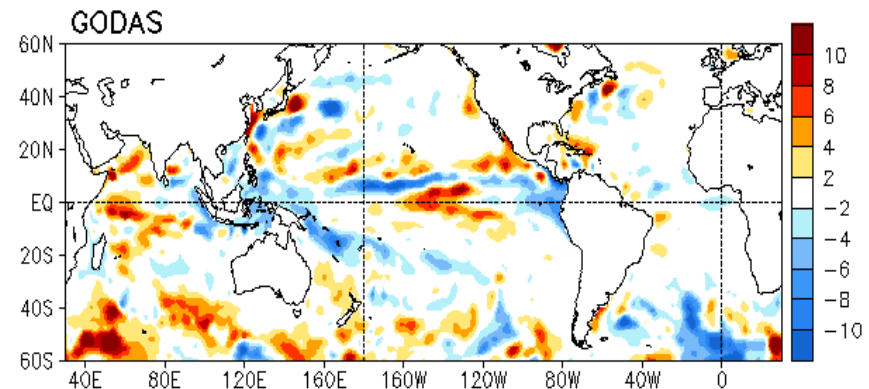

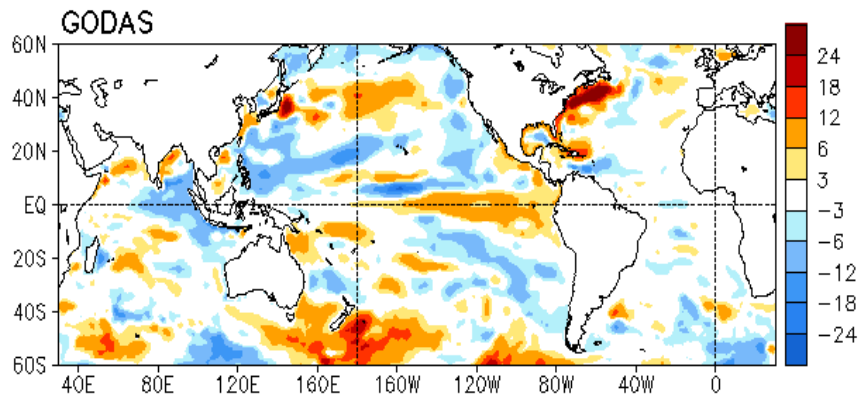

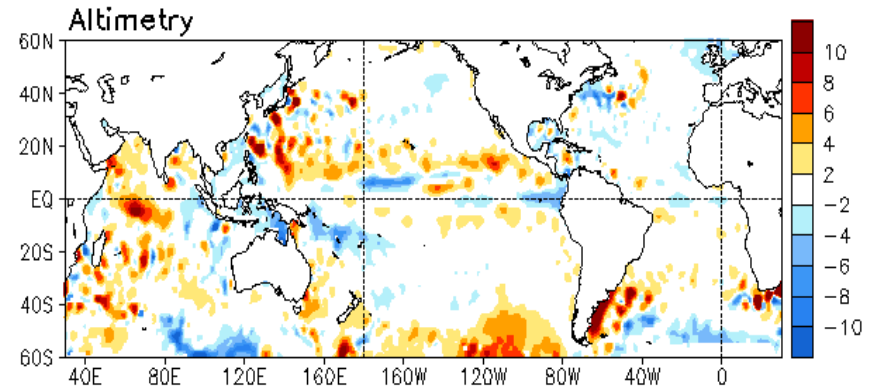

AVISO & GODAS SSH Anomaly (cm) and Anomaly Tendency

AUG 2023 SSH Anomaly (cm)
(climo. 1993–2020)

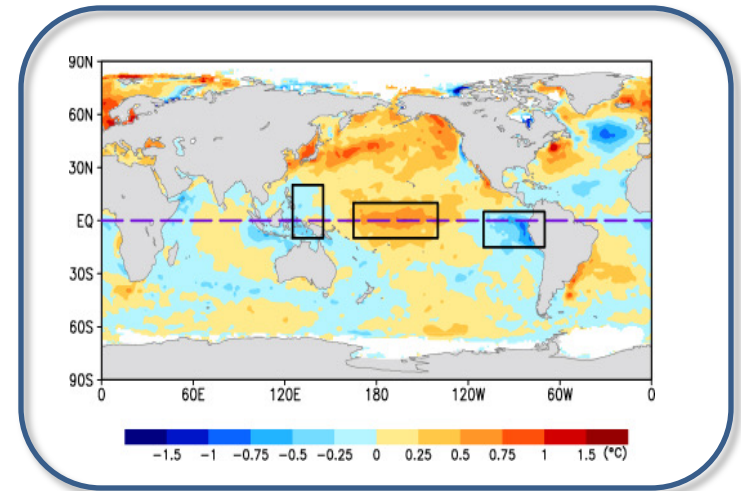

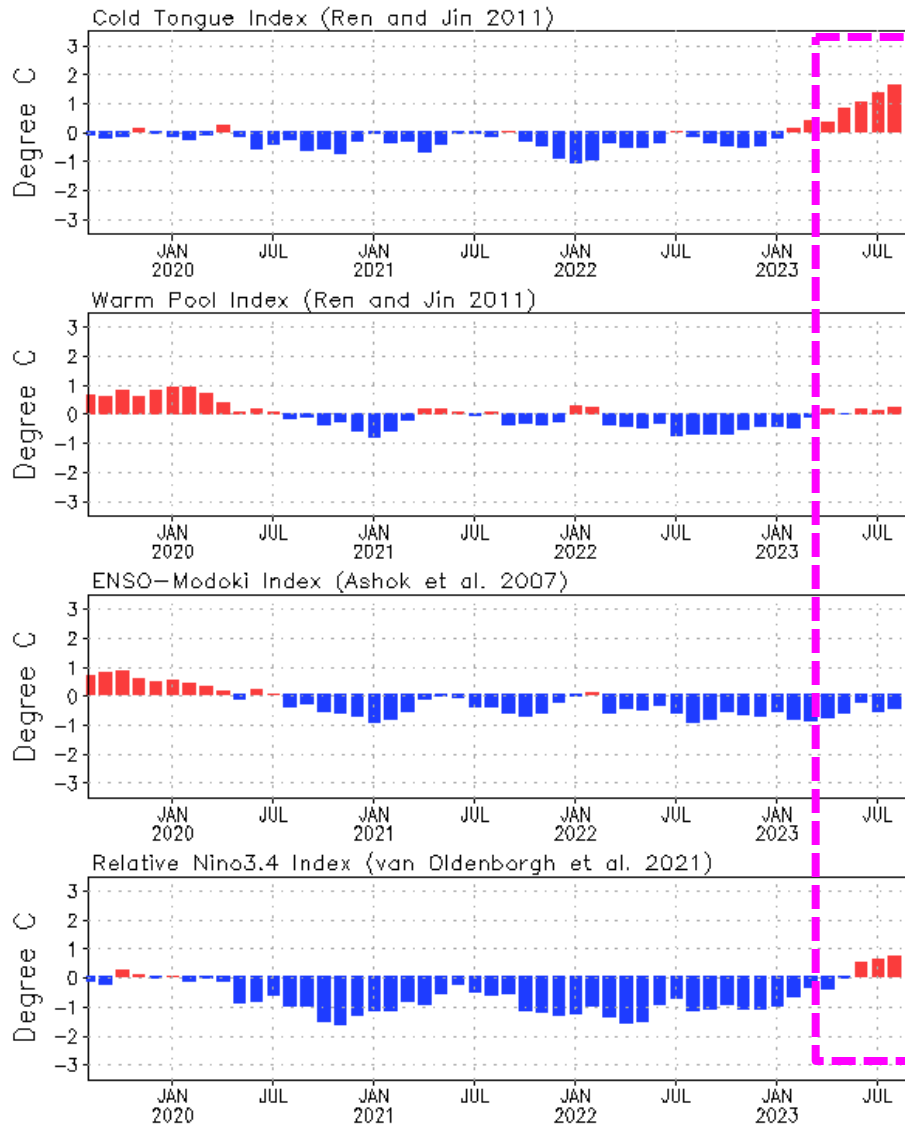

AUG 2023 – JUL 2023 SSH Anomaly (cm)
(climo. 1993–2020)

- SSHs were above normal in the equatorial Pacific in GODAS & AVISO.
- The tendencies indicated an increase (decrease) of SSH in the eastern (western) tropical Pacific.

Evolution of Pacific Niño SST Indices

Monthly Tropical Pacific SST Anomaly

- Relative Niño3.4 index is now included in ENSO monitoring, which is defined as the conventional Niño3.4 index minus the SSTA averaged in the whole tropics (0° - 360° , 20° S- 20° N), in order to remove the global warming signal. Also, to have the same variability as the conventional Niño3.4 index, the relative Niño3.4 index is renormalized (van Oldenborgh et al. 2021: ERL, 10.1088/1748-9326/abe9ed).

[Relative Niño3.4 data updated monthly at:
https://www.cpc.ncep.noaa.gov/data/indices/
RONI.ascii.txt](https://www.cpc.ncep.noaa.gov/data/indices/RONI.ascii.txt)

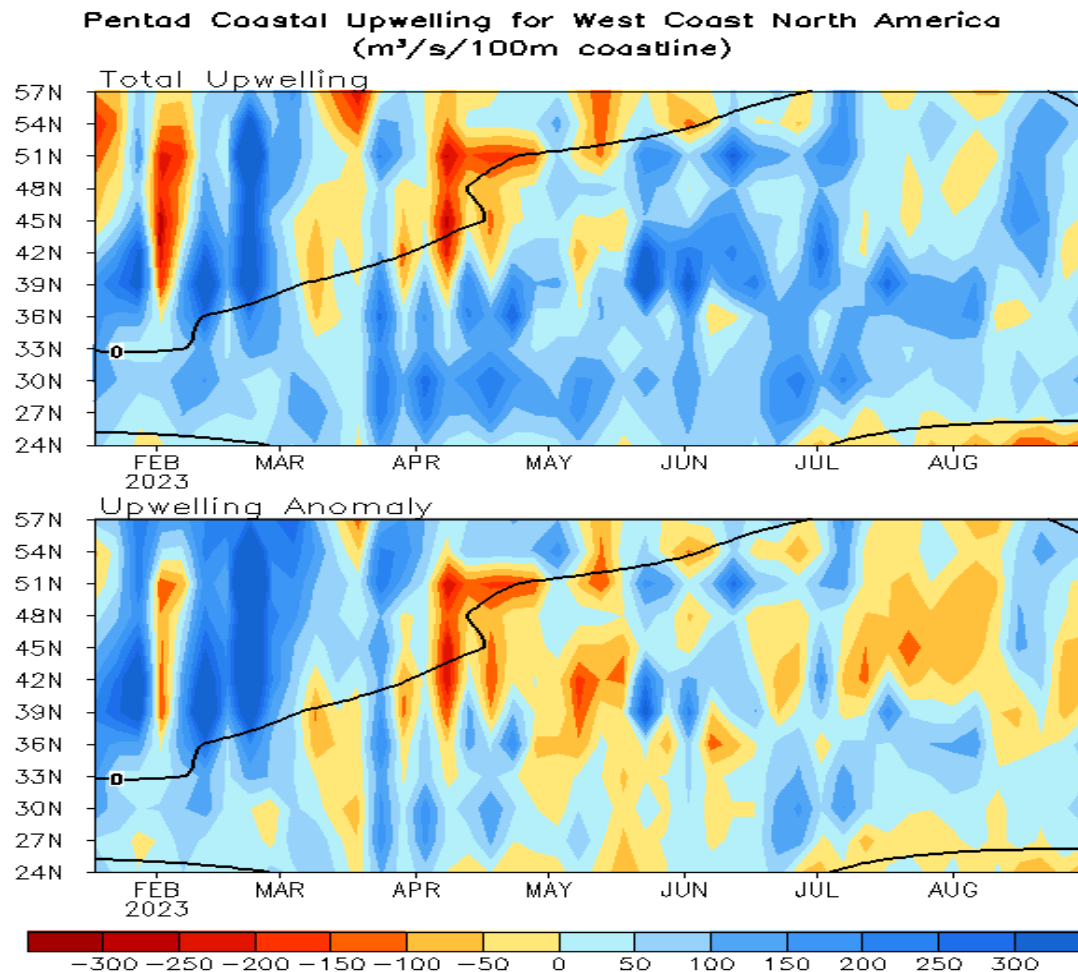

Pacific Decadal Oscillation (PDO) Index

- The PDO has been in a negative phase since Jan 2020 with PDOI = -1.9 in Jul 2023.
- Statistically, ENSO leads PDO by 3-4 months, through teleconnection via atmospheric bridge, with El Niño (La Niña) associated with positive (negative) PDO Index.

• PDO is defined as the 1st EOF of monthly ERSST v3b in the North Pacific for the period 1900-1993. PDO index is the standardized projection of the monthly SST anomalies onto the 1st EOF pattern.

North America Western Coastal Upwelling

Standard Positions of Upwelling Index Calculations

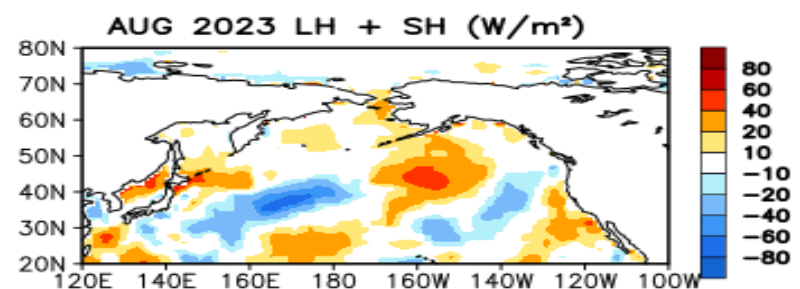

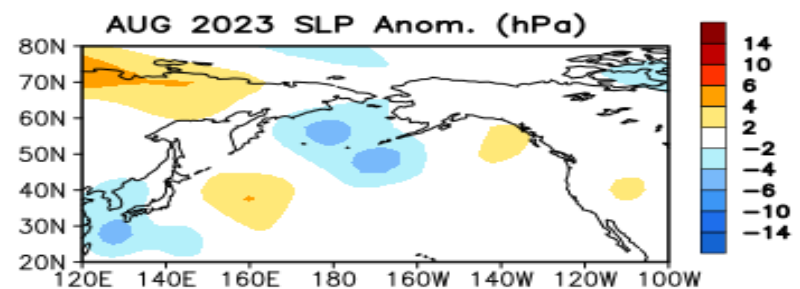

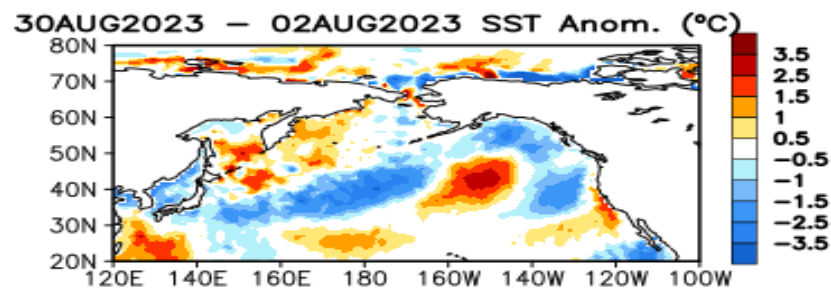

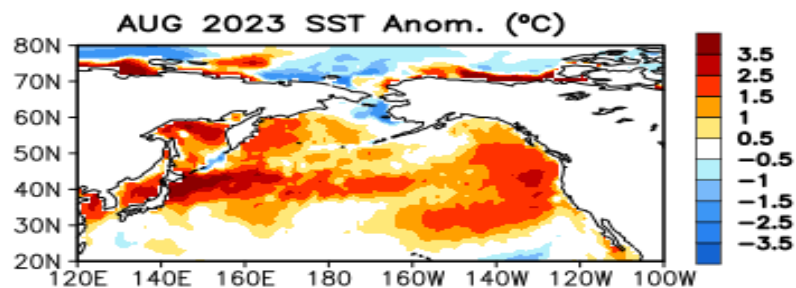

- Coastal (39° - 54° N) anomalous upwelling and downwelling were observed in Jul 2023.

(top) Total and (bottom) anomalous upwelling indices at the 15 standard locations for the western coast of North America. Derived from the vertical velocity of the NCEP's GODAS and are calculated as integrated vertical volume transport at 50-meter depth from each location to its nearest coast point ($\text{m}^3/\text{s}/100\text{m}$ coastline). Anomalies are departures from the 1991-2020 base period pentad means.

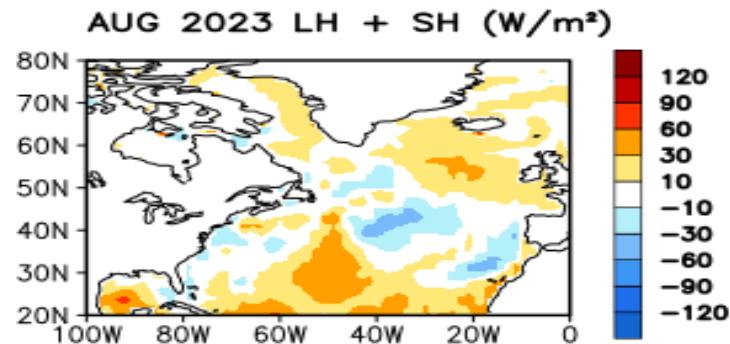

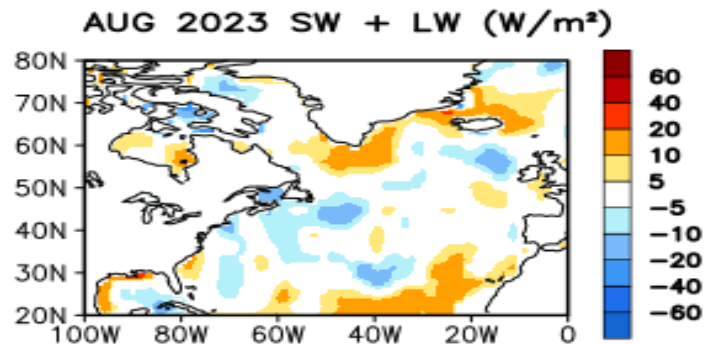

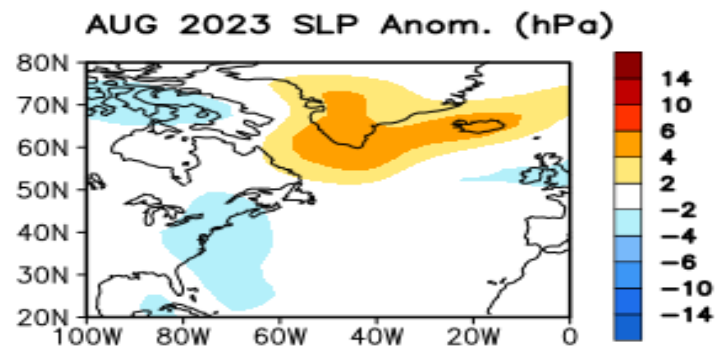

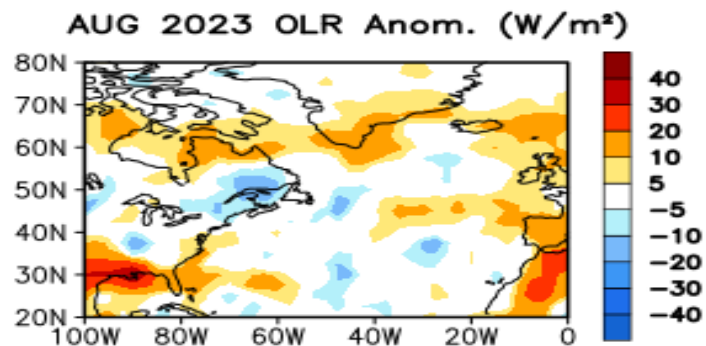

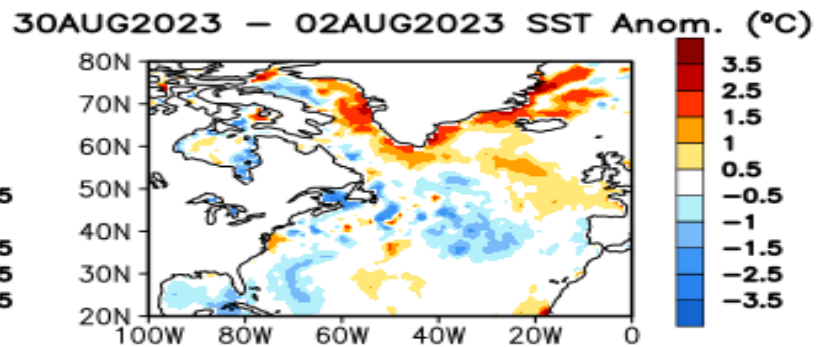

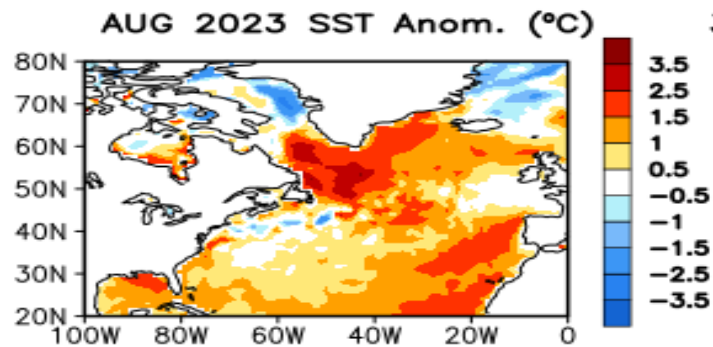

- Area below (above) black line indicates climatological upwelling (downwelling) season.

- Climatologically upwelling season progresses from March to July along the west coast of North America from 36° N to 57° N.

North Pacific & Arctic Ocean: SSTA, SSTA Tend., OLR, SLP, Sfc Rad, Sfc Flx Anomalies

SSTA (top-left; Olv2.1 SST Analysis), SSTA tendency (top-right), Outgoing Long-wave Radiation (OLR) (middle-left; NOAA 18 AVHRR IR), sea surface pressure (middle-right; NCEP CDAS), sum of net surface short- and long-wave radiation (bottom-left; positive means heat into the ocean; NCEP CDAS), sum of latent and sensible heat flux (bottom-right; positive means heat into the ocean; NCEP CDAS). Anomalies are departures from the 1991-2020 base period means.

Subsurface Temperature Anomaly in southern Gulf of Mexico

Anomalous Temperature (C) in [90W-70W, 15N-25N]

1979-present

Last 10 year

27 SEP 2023

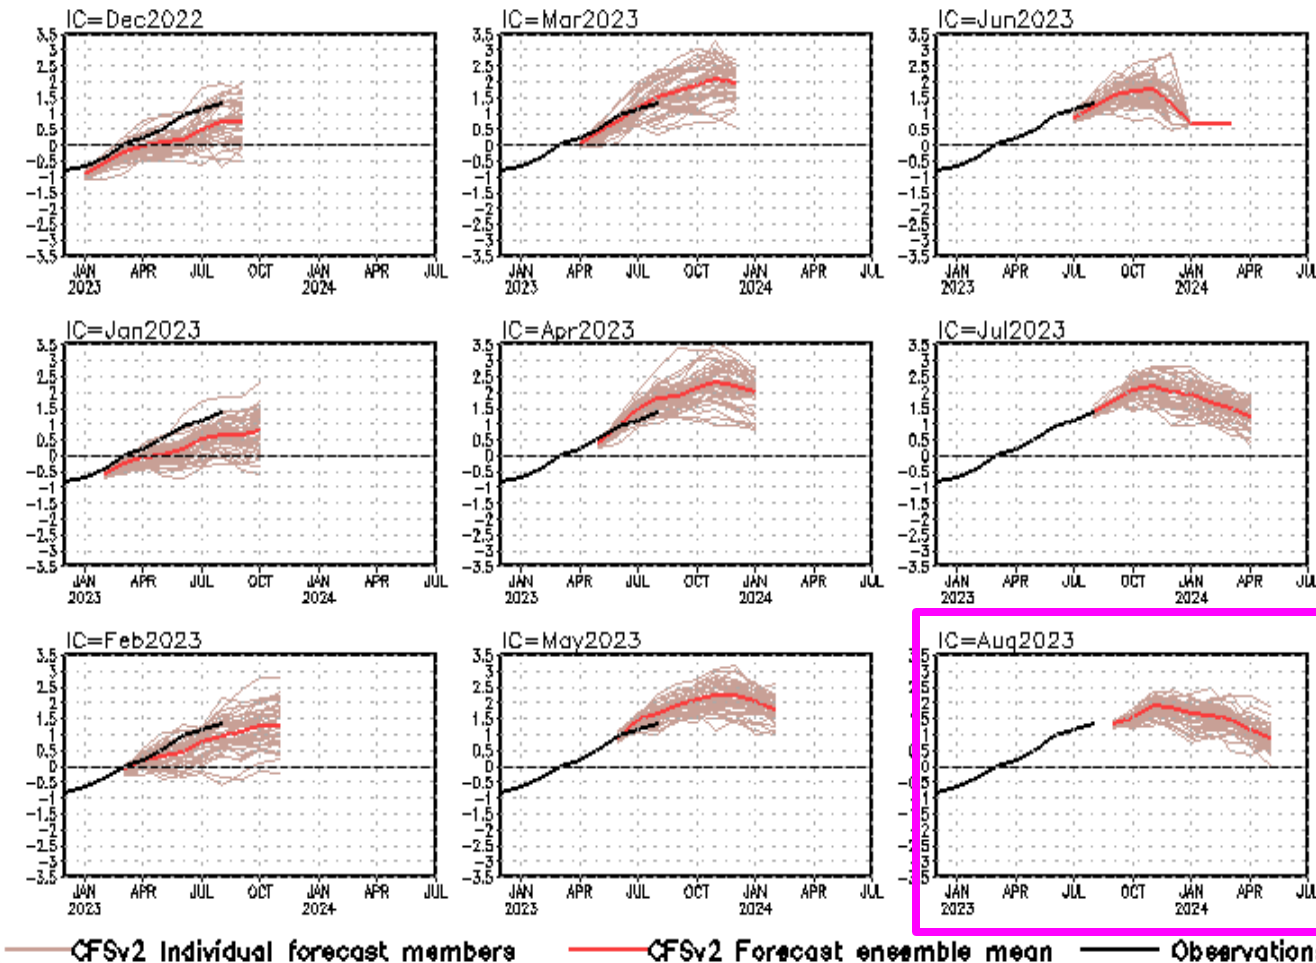

90W-70W, 15N-25N

- Subsurface warming near the Florida has persisted since 2014.

NINO3.4 SST anomalies (K)

- The latest CFSv2 forecasts call for an El Niño in the second half of 2023.

CFS Niño3.4 SST prediction from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). Anomalies were computed with respect to the 1991-2020 base period means.

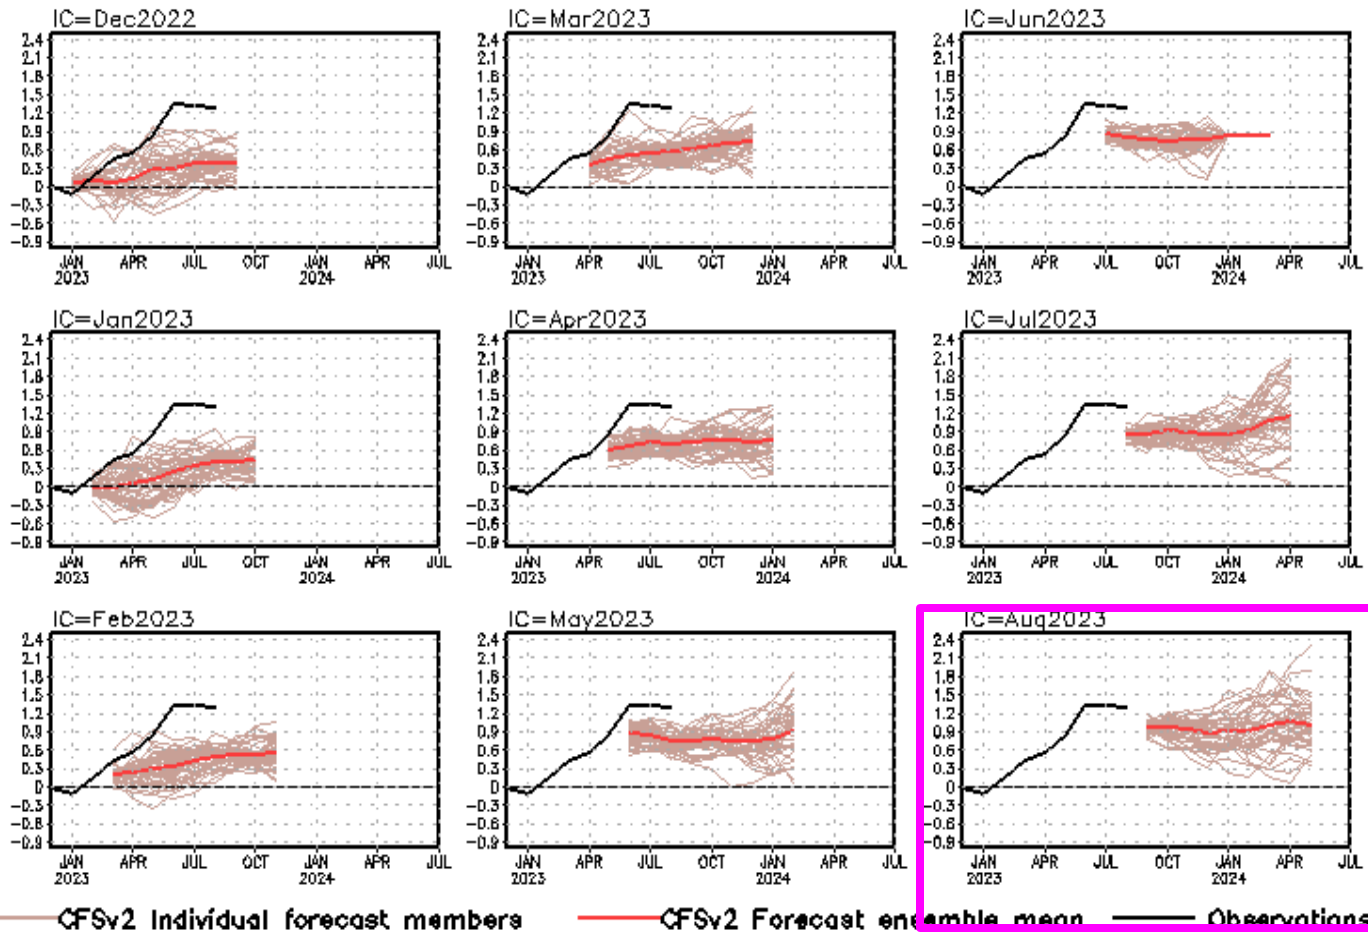

Indian Ocean Dipole SST anomalies (K)

- CFSv2 predicts a positive phase of IOD in the 2nd half of 2023.

CFS Dipole Model Index (DMI) SST predictions from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). The hindcast climatology for 1981-2006 was removed, and replaced by corresponding observation climatology for the same period. Anomalies were computed with respect to the 1991-2020 base period means.

Tropical N. Atlantic SST anomalies (K)

- Latest CFSv2 predictions call for above-normal SST in the tropical North Atlantic.

CFS Tropical North Atlantic (TNA) SST predictions from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). Anomalies were computed with respect to the 1991-2020 base period means. TNA is the SST anomaly averaged in the region of [60oW-30oW, 5oN-20oN].
