Global Ocean Monitoring:
Recent Evolution, Current Status, and Predictions

Prepared by
Climate Prediction Center, NCEP/NOAA
May 12, 2020

http://www.cpc.ncep.noaa.gov/products/GODAS/

This project to deliver real-time ocean monitoring products is implemented by CPC in cooperation with NOAA’s Global Ocean Monitoring and Observing Program (GOMO)
Outline

• Overview

• Recent highlights
  – Pacific/Arctic Ocean
  – Indian Ocean
  – Atlantic Ocean

• Global SSTA Predictions
  ➢ North Pacific Marine Heatwave status and prediction
Overview

- **Pacific Ocean**
  - ENSO neutral conditions persisted (NINO3.4 = 0.47°C).
  - Positive SSTAs strengthened in the NE Pacific in Apr 2020. The PDO was in a negative phase (PDOI = -0.79).

- **Indian Ocean**
  - Positive SSTAs were present in the entire tropical Indian Ocean in Apr 2020.

- **Atlantic Ocean**
  - NAO switched to a negative phase in Apr 2020 with NAOI= -1.26.
  - The prolonged tripole SSTA pattern persisted in Apr 2020, but was weaker than in Mar 2020.

- **Arctic Ocean**
  - The pace of sea ice loss in April was faster than Mar 2020; its extent ranked as the 4th lowest since 1979.
Global Oceans
Fig. G1. Sea surface temperature anomalies (top) and anomaly tendency (bottom). Data are derived from the NCEP OI SST analysis, and anomalies are departures from the 1981-2010 base period means.

- Positive SSTAs persisted in most of the tropical Pacific.
- Positive SSTAs strengthened in the NE Pacific.
- Weak tripole SSTA pattern persisted in the North Atlantic.
- Weak positive SSTAs were present across the tropical Indian basin.
- Positive SSTAs were present in the South Pacific.

- SSTA tendencies were small in the tropical Pacific.
- Negative SSTA tendencies presented in the tropical Atlantic and central southern Indian Oceans.
Longitude-Depth Temperature Anomaly and Anomaly Tendency in 2°S-2°N

Fig. G3. Equatorial depth-longitude section of ocean temperature anomalies (top) and anomaly tendency (bottom). Data are derived from the NCEP's global ocean data assimilation system which assimilates oceanic observations into an oceanic GCM. Anomalies are departures from the 1981-2010 base period means.

- Negative temperature anomalies presented along the thermocline in both the equatorial Pacific and Atlantic Oceans.

- Positive temperature anomalies were observed in the upper ocean of three tropical basins.

- Temperature anomaly tendency was negative along the thermocline in the central Pacific and Atlantic.
The SSHA pattern was overall consistent with the HC300A pattern, but with a significant trend component in SSHA.

Both SSHA and HC300A tendencies were negative in the central equatorial Pacific.
- Positive SSS anomalies were present across most of the north hemisphere ocean, and the south tropical Atlantic.

- The tendency distribution similar to the anomaly one, suggesting a persistence and enhancement of the March state.
Tropical Pacific Ocean and ENSO Conditions
Evolution of Pacific NINO SST Indices

Monthly Tropical Pacific SST Anomaly
(CISST, 1981–2010 Climatology)

- All Nino indices were positive, with Nino3.4 = 0.47°C in Apr 2020.
- Compared with Apr 2019, the central and eastern (western) equatorial Pacific was cooler (warmer) in Apr 2020.
- The indices may have slight differences if calculations are based on different SST products.

Fig. P1a. Nino region indices, calculated as the area-averaged monthly mean sea surface temperature anomalies (°C) for the specified region. Data are derived from the NCEP OI SST analysis, and anomalies are departures from the 1981-2010 base period means.
- Warm pool and ENSO-Modoki indices remain positive since 2018, and weakened in Apr 2020.
Fig. P2. Sea surface temperature (SST) anomalies (top-left), anomaly tendency (top-right), Outgoing Long-wave Radiation (OLR) anomalies (middle-left), sum of net surface short- and long-wave radiation, latent and sensible heat flux anomalies (middle-right; positive means heat into the ocean), 925-mb wind anomaly vector and its amplitude (bottom-left), 200-mb wind anomaly vector and its amplitude (bottom-right). SST are derived from the NCEP OI SST analysis, OLR from the NOAA 18 AVHRR IR window channel measurements by NESDIS, winds and surface radiation and heat fluxes from the NCEP CDAS. Anomalies are departures from the 1981-2010 base period means.
An MJO event occurred since mid-April 2020

https://www.cpc.ncep.noaa.gov/products/precip/CWlink/MJO/mjo.shtml#current
- Partially contributed by the MJO event, easterly wind anomaly was present over the central Pacific in Apr 2020.
- Below-average HC300 was observed in the central Pacific in Apr 2020.
- Positive SSTA persisted in the entire equatorial Pacific.
- Negative ocean temperature anomalies propagated slowly eastwards.

- The features of the ocean temperature anomalies were similar between GODAS and TAO analysis.
Oceanic Kelvin Wave (OKW) Index

-Upwelling Kelvin wave activities were present in Mar-Apr 2020.

(OKW index is defined as standardized projections of total anomalies onto the 14 patterns of Extended EOF1 of equatorial temperature anomalies (Seo and Xue, GRL, 2005).)

16
Evolution of Equatorial Pacific Surface Zonal Current Anomaly (cm/s)

- Anomalous westward currents were observed across much of the equatorial Pacific in Apr 2020 in both OSCAR and GODAS.
- WWV is defined as average of depth of 20°C in [120°E-80°W, 5°S-5°N]. Statistically, peak correlation of Nino3 with WWV occurs at 7 month lag (Meinen and McPhaden, 2000).

- Since WWV is intimately linked to ENSO variability (Wyrtki 1985; Jin 1997), it is useful to monitor ENSO in a phase space of WWV and NINO3.4 (Kessler 2002).

- Increase (decrease) of WWV indicates recharge (discharge) of the equatorial oceanic heat content.

- Equatorial Warm Water Volume (WWV) has been in a discharge phase since Mar 2020.

Fig. P3. Phase diagram of Warm Water Volume (WWV) and NINO 3.4 SST anomalies. WWV is the average of depth of 20°C in [120°E-80°W, 5°S-5°N] calculated with the NCEP's global ocean data assimilation system. Anomalies are departures from the 1981-2010 base period means.
Projection of OTA onto EOF1 and EOF2 (2S-2N, 0-459m, 1979-2010)

EOF1: Tilt mode (ENSO peak phase);
EOF2: WWV mode, Recharge/discharge oscillation (ENSO transition phase).

Recharge process: heat transport from outside of equator to equator:
Negative -> positive phase of ENSO

Discharge process: heat transport from equator to outside of equator:
Positive -> Negative phase of ENSO

For details, see:
North Pacific & Arctic Oceans
PDO is defined as the 1st EOF of monthly ERSST v3b in the North Pacific for the period 1900-1993. PDO index is the standardized projection of the monthly SST anomalies onto the 1st EOF pattern. The PDO was in a negative phase with PDOI = -0.79 in Apr 2020. Statistically, ENSO leads PDO by 3-4 months, through teleconnection via atmospheric bridge, with El Nino (La Nina) associated with positive (negative) PDO Index.

- Pacific Decadal Oscillation is defined as the 1st EOF of monthly ERSST v3b in the North Pacific for the period 1900-1993. PDO index is the standardized projection of the monthly SST anomalies onto the 1st EOF pattern.
- The PDO index differs slightly from that of JISAO, which uses a blend of UKMET and OIv1 and OIv2 SST.
North America Western Coastal Upwelling

Area below (above) black line indicates climatological upwelling (downwelling) season.

Climatologically upwelling season progresses from March to July along the west coast of North America from 36°N to 57°N.

- Upwelling north of 35N was stronger than average since Feb 2020.

Fig. NP2. Total (top) and anomalous (bottom) upwelling indices at the 15 standard locations for the western coast of North America. Upwelling indices are derived from the vertical velocity of the NCEP's global ocean data assimilation system, and are calculated as integrated vertical volume transport at 50 meter depth from each location to its nearest coast point (m³/s/100m coastline). Anomalies are departures from the 1981-2010 base period pentad means.
North America Western Coastal Upwelling

- Area below (above) black line indicates climatological upwelling (downwelling) season.
- Climatologically upwelling season progresses from March to July along the west coast of North America from 36°N to 57°N.
- Arctic sea ice extent was well below the normal in Apr 2020.
- The monthly average extent for Apr 2020 of 13.73 million square kilometers ended up as the fourth lowest since satellite observations in 1979.
- The pace of sea ice decline in April was near average, faster than in Mar 2020.
Arctic sea ice extent (SIE) forecast
Experimental CFSv2 initialized April 21–25, 2020

First sea ice melt date of 2020
Experimental CFSv2 initialized April 21–25, 2020

Indian Ocean
Evolution of Indian Ocean SST Indices

Fig. I1a. Indian Ocean Dipole region indices, calculated as the area-averaged monthly mean sea surface temperature anomalies (°C) for the SETIO [90°E-110°E, 10°S-0] and WTIO [50°E-70°E, 10°S-10°N] regions, and Dipole Mode Index, defined as differences between WTIO and SETIO. Data are derived from the NCEP OI SST analysis, and anomalies are departures from the 1981-2010 base period means.

- Positive SSTAs were present in the entire tropical Indian Ocean in Apr 2020.

- SSTAs were overall positive in the entire tropical Indian Ocean.

- Convections were suppressed (enhanced) over the eastern Indian Ocean and the Maritime Continent (the western Indian Ocean).

Fig. I2. Sea surface temperature (SST) anomalies (top-left), anomaly tendency (top-right), Outgoing Long-wave Radiation (OLR) anomalies (middle-left), sum of net surface short- and long-wave radiation, latent and sensible heat flux anomalies (middle-right), 925-mb wind anomaly vector and its amplitude (bottom-left), 200-mb wind anomaly vector and its amplitude (bottom-right). SST are derived from the NCEP OI SST analysis, OLR from the NOAA 18 AVHRR IR window channel measurements by NESDIS, winds and surface radiation and heat fluxes from the NCEP CDAS. Anomalies are departures from the 1981-2010 base period means.
Tropical and North Atlantic Ocean
Evolution of Tropical Atlantic SST Indices

Fig. A1a. Tropical Atlantic Variability region indices, calculated as the area-averaged monthly mean sea surface temperature anomalies (°C) for the TNA [60°W-30°W, 5°N-20°N], TSA [30°W-10°E, 20°S-0] and ATL3 [20°W-0, 2.5°S-2.5°N] regions, and Meridional Gradient Index, defined as differences between TNA and TSA. Data are derived from the NCEP OI SST analysis, and anomalies are departures from the 1981-2010 base period means.

- Indices representing the Atlantic Meridional and Nino modes were small (<0.5 C) in Apr 2020.
Fig. NA2. Monthly standardized NAO index (top) derived from monthly standardized 500-mb height anomalies obtained from the NCEP CDAS in 20ºN-90ºN (http://www.cpc.ncep.noaa.gov). Time-Latitude section of SST anomalies averaged between 80ºW and 20ºW (bottom). SST are derived from the NCEP OI SST analysis, and anomalies are departures from the 1981-2010 base period means.

- NAO switched to a negative phase in Apr 2020 with NAOI = -1.26.
- The prolonged tripole SSTA pattern persisted in Apr 2020, but weaker than in Mar 2020 due to the change in NAO phase.
ENSO and Global SST Predictions
- Predictions with ICs in Apr 2020 diverged greatly; most models predicted an ENSO-neutral state through boreal summer/fall 2020.

- NOAA “ENSO Diagnostic Discussion” on 9 Apr 2020 stated that “ENSO-neutral is favored for the Northern Hemisphere summer 2020 (~60% chance), remaining the most likely outcome through autumn.”
Individual Model Forecasts: ENSO—Neutral or Boardline La Nina

**EC: Nino3.4, IC=01May 2020**

NINO3.4 SST anomaly plume

CFS Niño3.4 SST Predictions from Different Initial Months

NINO3.4 SST anomalies (K)

- CFSv2 had a cold forecast bias with ICs during May-Dec 2019.

- The latest forecasts call for a La Nina event, but predicted strength is weaker than March predictions.

Fig. M1. CFS Nino3.4 SST prediction from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). Anomalies were computed with respect to the 1981-2010 base period means.
CFS Pacific Decadal Oscillation (PDO) Index Predictions from Different Initial Months

Fig. M4. CFS Pacific Decadal Oscillation (PDO) index predictions from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). Anomalies were computed with respect to the 1981-2010 base period means.

PDO is the first EOF of monthly ERSSTv3b anomaly in the region of [110°E-100°W, 20°N-60°N].

CFS PDO index is the standardized projection of CFS SST forecast anomalies onto the PDO EOF pattern.

- CFSv2 predicts a negative phase of PDO in coming seasons.
CFS Tropical North Atlantic (TNA) SST Predictions from Different Initial Months

Tropical N. Atlantic SST anomalies (K)

Fig. M3. CFS Tropical North Atlantic (TNA) SST predictions from the latest 9 initial months. Displayed are 40 forecast members (brown) made four times per day initialized from the last 10 days of the initial month (labelled as IC=MonthYear) as well as ensemble mean (blue) and observations (black). Anomalies were computed with respect to the 1981-2010 base period means.
North Pacific Marine Heatwave Status and Prediction
Marine Heatwave strengthened in North Pacific in April 2020
North Pacific & Arctic Ocean: SST Anom., SST Anom. Tend., OLR, SLP, Sfc Rad, Sfc Flx

Fig. NP1. Sea surface temperature (SST) anomalies (top-left), anomaly tendency (top-right), Outgoing Long-wave Radiation (OLR) anomalies (middle-left), sea surface pressure anomalies (middle-right), sum of net surface short- and long-wave radiation anomalies (bottom-left; positive means heat into the ocean), sum of latent and sensible heat flux anomalies (bottom-right; positive means heat into the ocean). SST are derived from the NCEP OI SST analysis, OLR from the NOAA 18 AVHRR IR window channel measurements by NESDIS, sea surface pressure and surface radiation and heat fluxes from the NCEP CDAS. Anomalies are departures from the 1981-2010 base period means.
The warming has extended to depth in Apr 2020.

Spatial Distribution of SSTA prediction skill with CFSv2

(Guan et al. 2014)

- ENSO-related SST presents the highest prediction skill;
- Other skillful regions include: tropical North Atlantic, South Pacific, tropical Indian Ocean, part of extratropical North Pacific,...
Global Sea Surface Salinity (SSS) Anomaly for April 2020

• New Update: The input satellite sea surface salinity of SMAP from NSAS/JPL was changed from Version 4.0 to Near Real Time product in August 2018.

• Positive SSS anomalies appear in most areas within the latitudes between 0° and 40°N in the N. Pacific Ocean and N. Atlantic Ocean, and between 0° and 20°N in the Indian Ocean. Negative SSS signal in the west equatorial Pacific region is persistent but weakening. While, in the eastern equatorial Pacific Ocean, negative SSS anomalies appear, which is accompanied with increased precipitation. Negative SSS anomalies are in the northern region of Bay of Bengal and is likely caused by increased precipitation.

• Data used
  SSS: Blended Analysis of Surface Salinity (BASS) V0.2
  (a CPC-NESDIS/NODC-NESDIS/STAR joint effort)
  (Xie et al. 2014)
  [ftp.cpc.ncep.noaa.gov/precip/BASS]
  Precipitation: CMORPH adjusted satellite precipitation estimates
  Evaporation: Adjusted CFS Reanalysis
Compared with last month, the SSS continued increasing in most areas of the N. Pacific ocean, N. Atlantic and N. Indian Ocean. The SSS signal became negative in the east Equatorial Pacific Ocean with increased precipitation in the area. The SSS decreased in the Bay of Bengal especially in the North region, and such signal is accompanied with increased precipitation. In the equator of Atlantic Ocean, the increased SSS is likely due to the reduced precipitation.
Global Sea Surface Salinity (SSS)

Anomaly Evolution over Equatorial Pacific from Monthly SSS

NOTE: Since June 2015, the BASS SSS is from in situ, SMOS and SMAP; before June 2015, the BASS SSS is from in situ, SMOS and Aquarius.

- Hovemoller diagram for equatorial SSS anomaly (5°S-5°N);
- In the equatorial Pacific Ocean, the SSS signal is negative west of 170°W; the SSS shows positive anomalies east of 170°W, while negative SSS signal appears east of 125°W.
Global Sea Surface Salinity (SSS) Anomaly Evolution along the Equatorial Pacific from Pentad SSS

Figure caption:
Hovemoller diagram for equatorial (5°S-5°N) 5-day mean SSS, SST and precipitation anomalies. The climatology for SSS is Levitus 1994 climatology. The SST data used here is the OISST V2 AVHRR only daily dataset with its climatology being calculated from 1985 to 2010. The precipitation data used here is the adjusted CMORPH dataset with its climatology being calculated from 1999 to 2013.
