

# **MJO Impacts on Winter Weather Event Frequency**

**Stephen Foskey, Naoko Sakaeda**

**University of Oklahoma**

**26 October 2021**

**Climate Diagnostics and Prediction Workshop**

# Winter Weather

- Winter weather events have large societal impacts and are challenging to predict
  - Texas/Oklahoma winter storms caused 100+ deaths, billions of dollars of damage from power crisis
- Subseasonal-to-seasonal (S2S) prediction of winter weather
  - MJO has significant influence on eastern New England snowfall (Klotzbach et al. 2016) and impacts on 2009-10 winter over Mid-Atlantic U.S. (Moon et al. 2011)
  - Limited research on MJO impacts on winter weather over entire U.S.
  - MJO major source of S2S predictability

# Subseasonal Predictability

- MJO has significant impacts on upper level heights out to 14 days (S2S)
- But these impacts have not been tied to winter weather frequency over the United States

## 500 hPa height anomalies associated with MJO phase

0-4 day lag

5-9 day lag

10-14 day lag

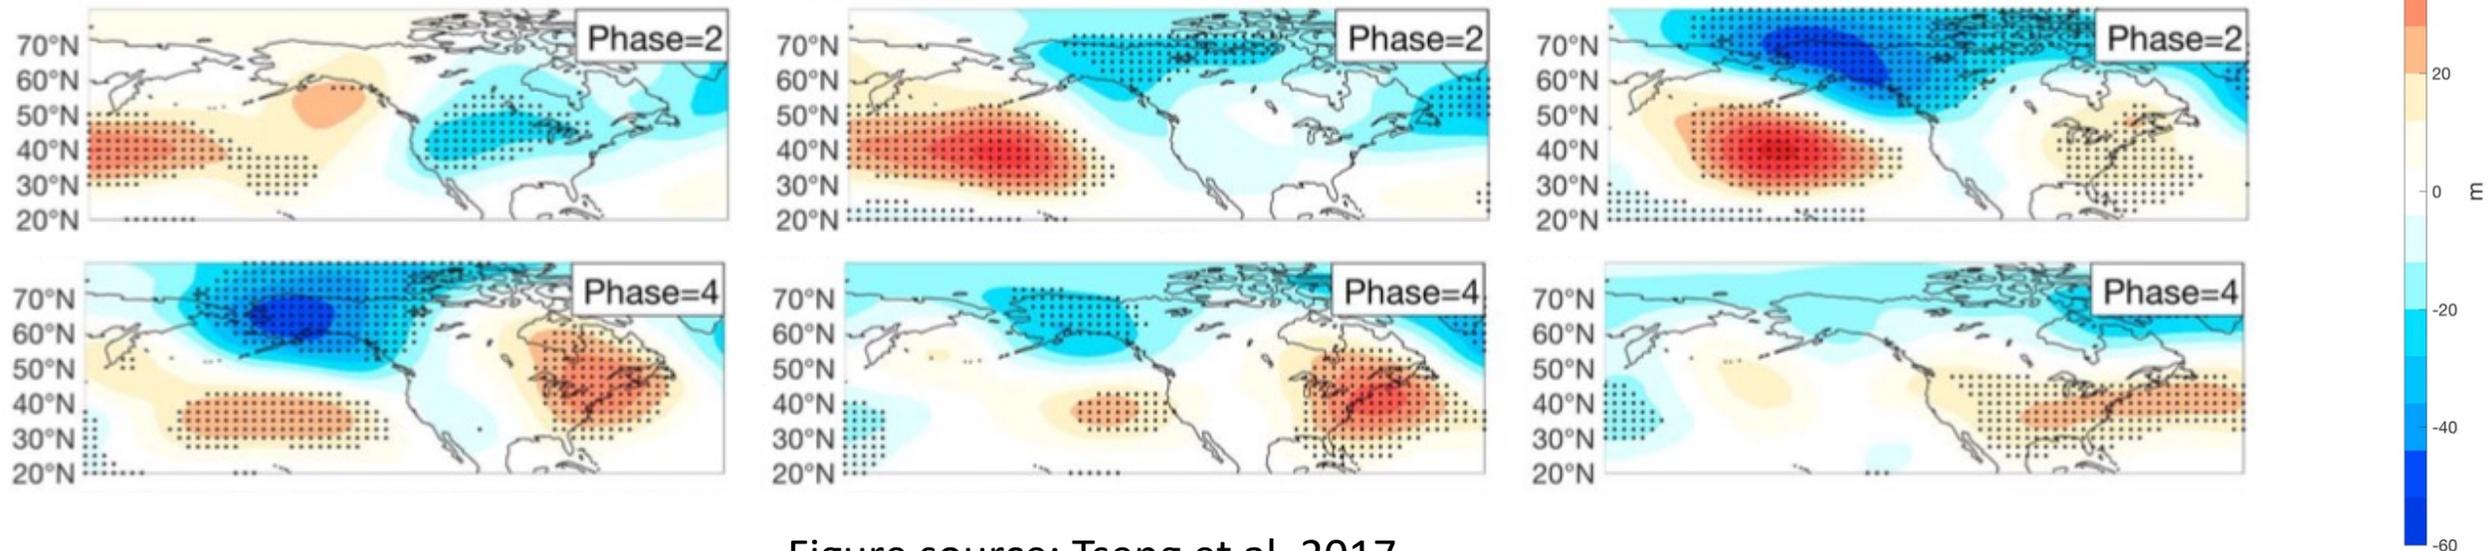

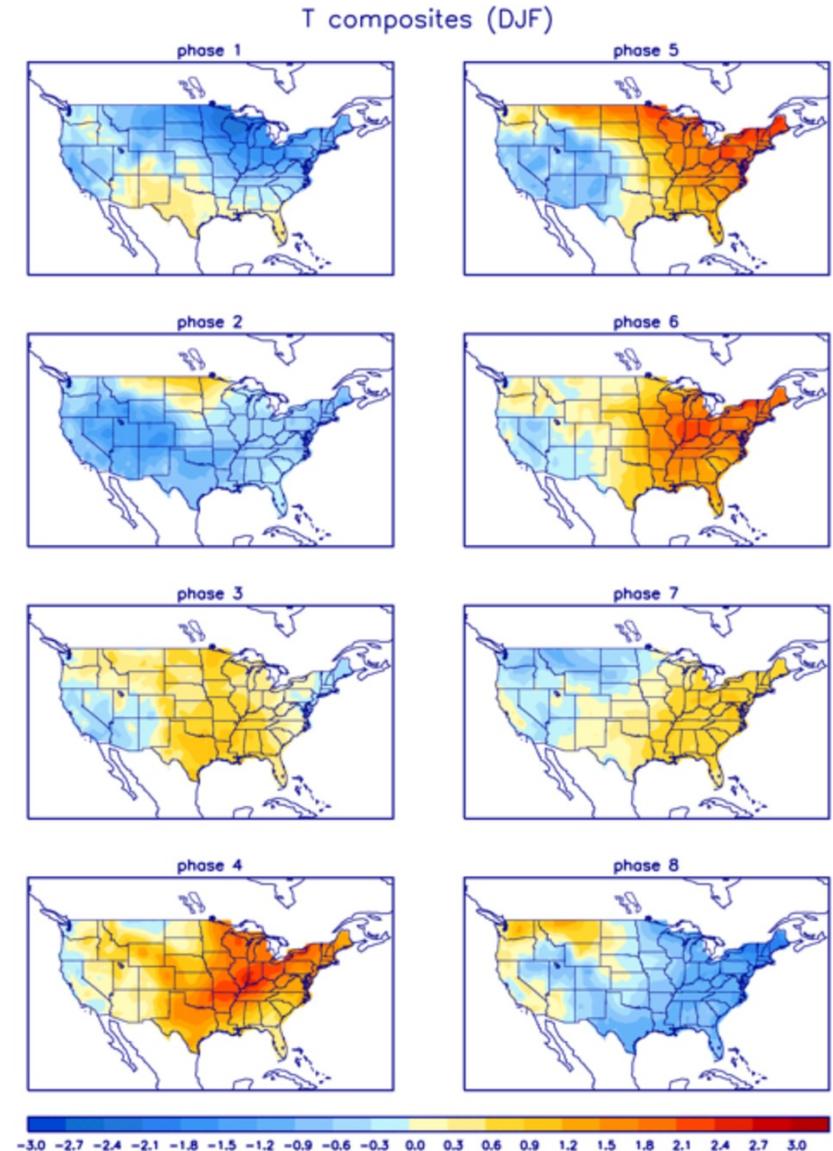

Figure source: Tseng et al. 2017

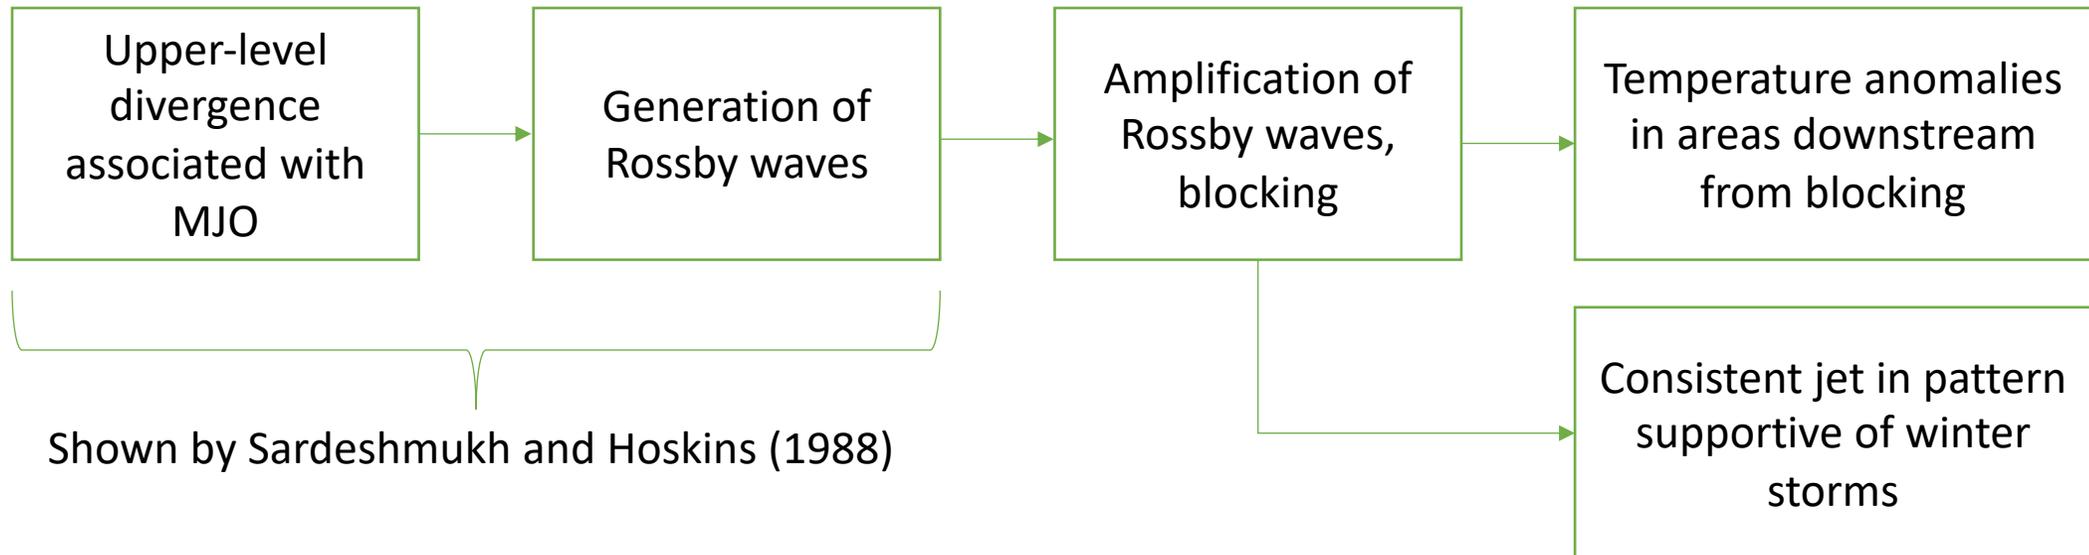

# Past Research on Extratropical Impacts of MJO

- Temperature over Arctic and Mid-Latitudes (e.g. Vecchi and Bond 2004, Matsueda and Takaya 2015)
- Connections to stratosphere (e.g. Green and Furtado 2019)
- And more!

# Goals

- Research question: How does the **phase of the MJO** impact the **frequency of winter weather** events over the United States?
- Hypothesis: Changes in winter weather frequency are caused by changes in the flow pattern influenced by MJO and its effect on **temperature** and **dynamic processes**

# Measuring the MJO

- Outgoing Longwave Radiation MJO Index (OMI)
  - Measures MJO based on **OLR**
- Real-Time MJO Monitoring Index (RMM)
  - Measures MJO based on **OLR** and **850 and 200 hPa winds**
- Sensitivity to the choice of indices will be tested

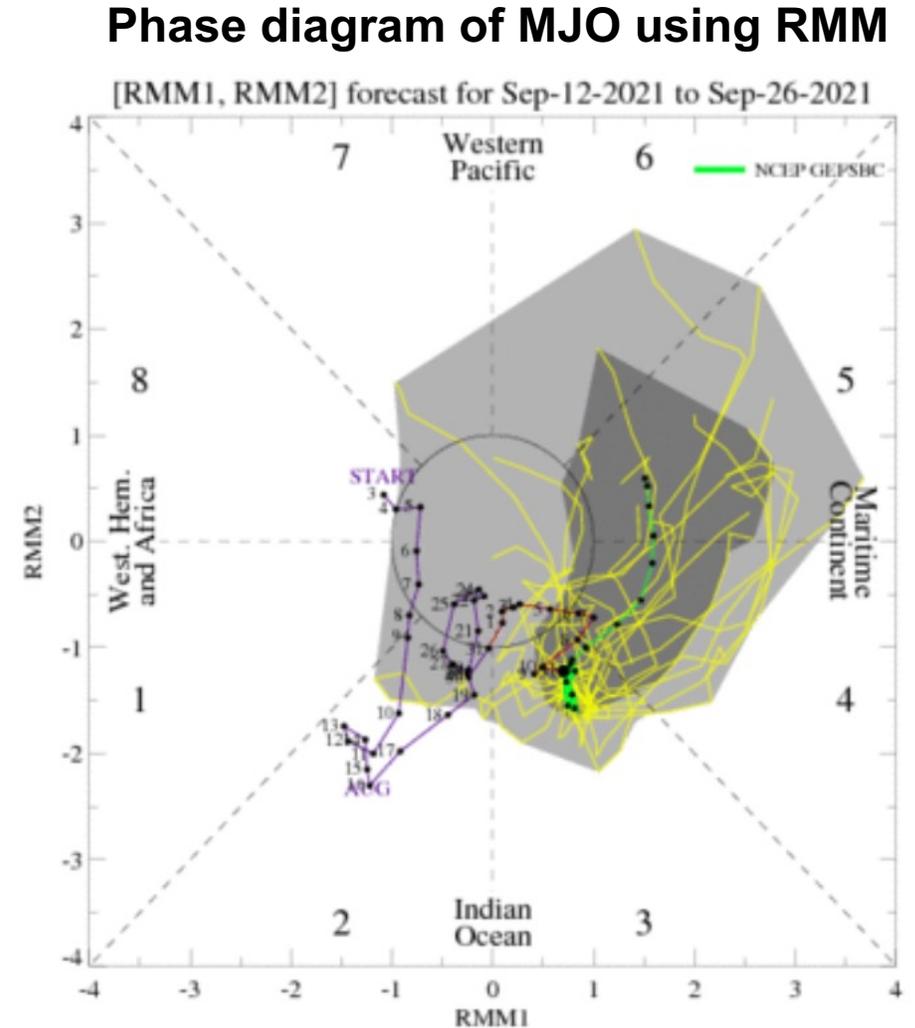

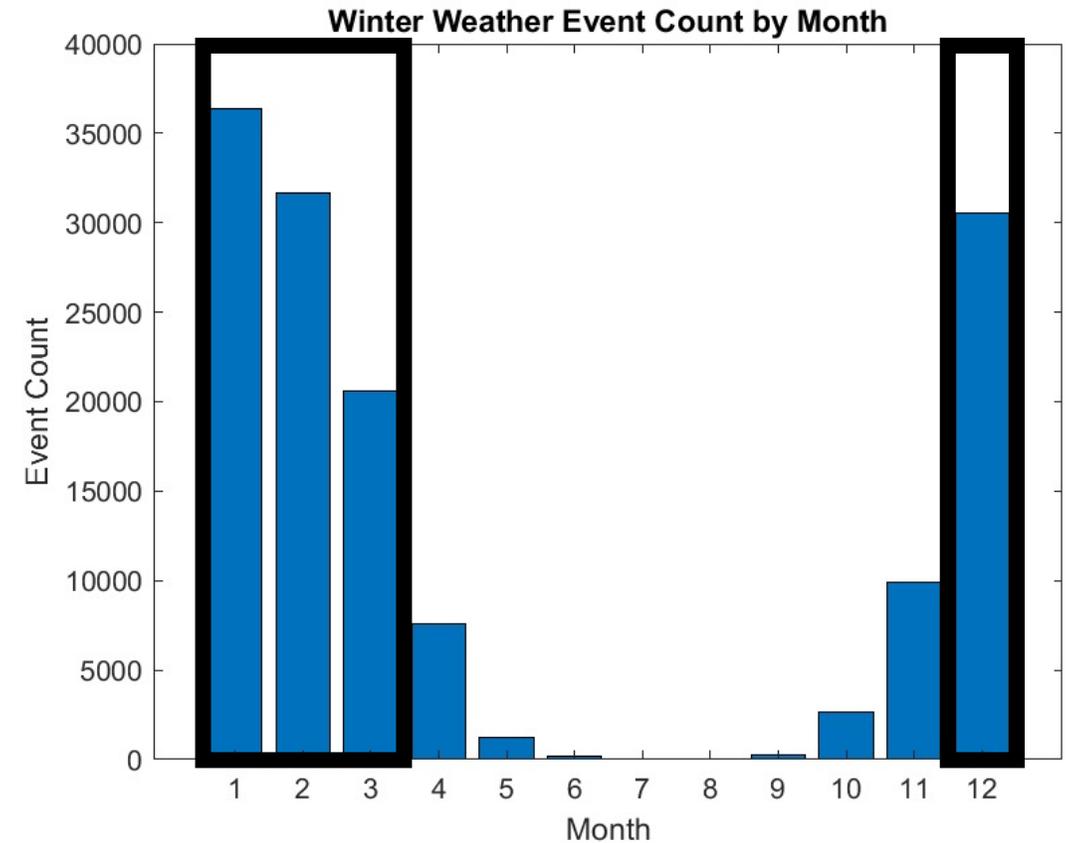

Figure source: NWS CPC

# Methods

- National Centers for Environmental Information (NCEI) **Storm Event Database** contains impactful winter weather events across US
  - 1996-2018
  - Events that meet winter storm warning criteria
- December-March selected as study period based on storm event count

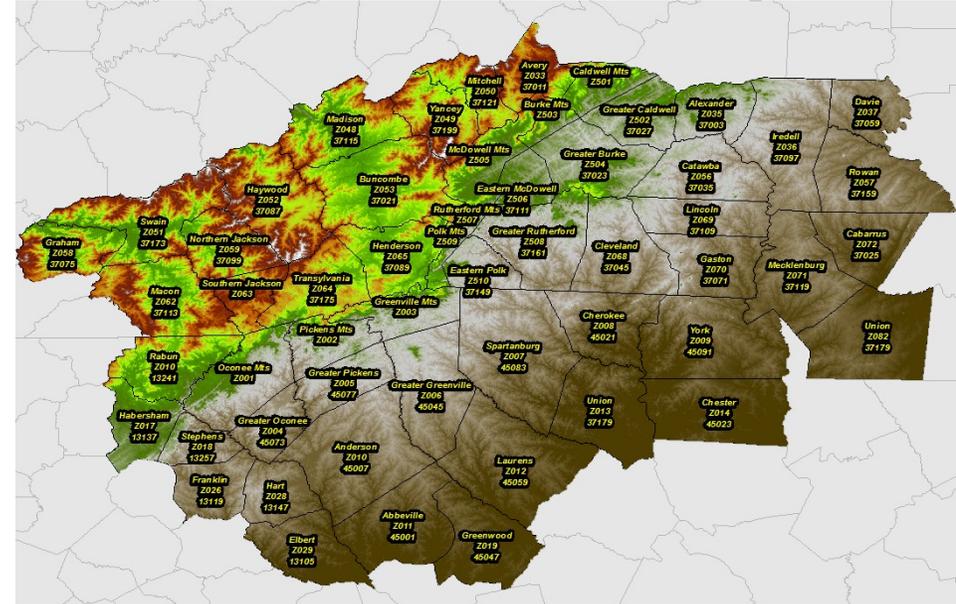

# Storm Types

Ice Storm	Heavy Snow	Winter Storm
Ice accretion exceeding locally defined warning criteria	Snow accumulation exceeding locally defined warning criteria	Winter weather event with <b>multiple significant hazards</b>
Usually at least <b>0.25-0.5"</b> (6.3-12.5 mm) of <b>ice</b>	Usually at least <b>4-10"</b> (10-25 cm) of <b>snow</b>	At least 0.25-0.5" (6.3-12.5 mm) of freezing rain, 4-10" (10-25 cm) of snow, and/or 1-2" (2.5-5 cm) of sleet
No sleet or snow	No freezing rain or sleet	Some combination of snow, sleet, freezing rain, blowing snow

# Definition of Frequency

- Storm reports based on **warning zones**
  - Generally one county or part of a county
  - Grouped by **weather forecast office (WFO)**
    - WFOs have different criteria for heavy snow

$$\text{climatological frequency} = \frac{\text{number of reports in WFO}}{\text{number of days} \times \text{number of zones in WFO}}$$

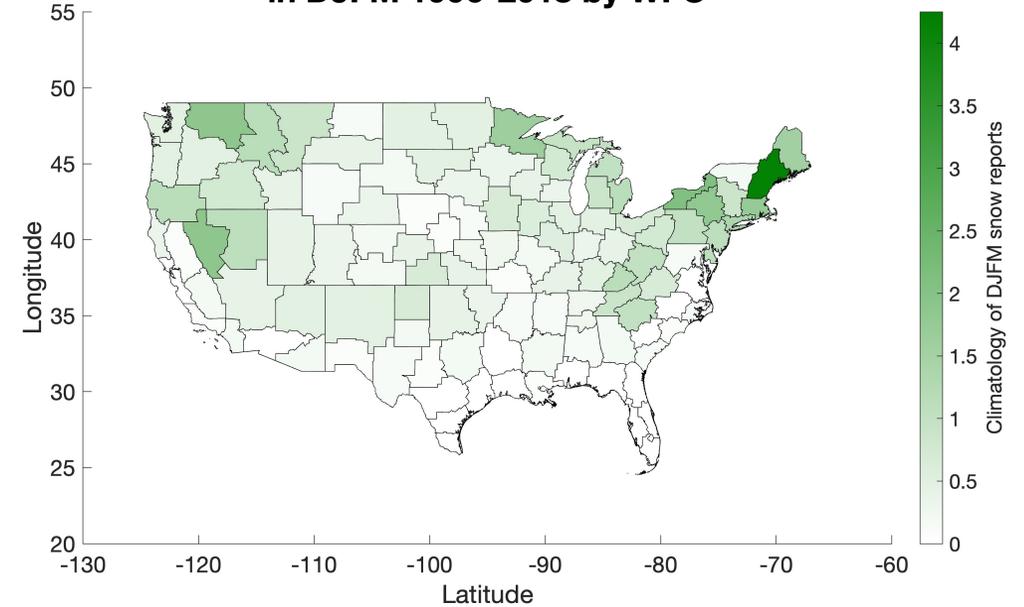

Source: NWS Greenville-Spartanburg

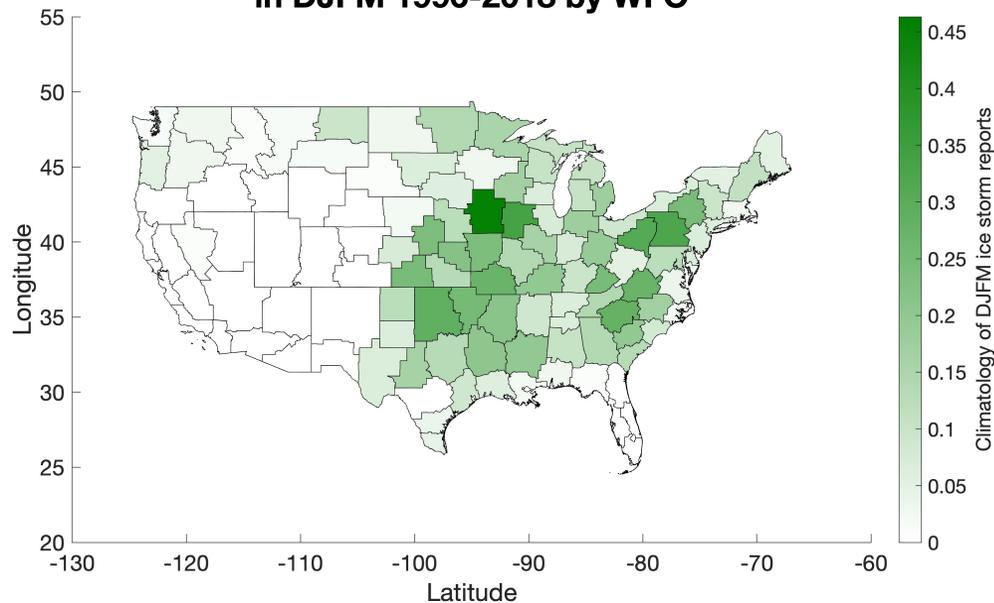

# Climatology

- Heavy snow most frequent in Northeast and Northwest
- Winter storms most frequent in North
- Ice storms most frequent in Central US
  - Less frequent overall

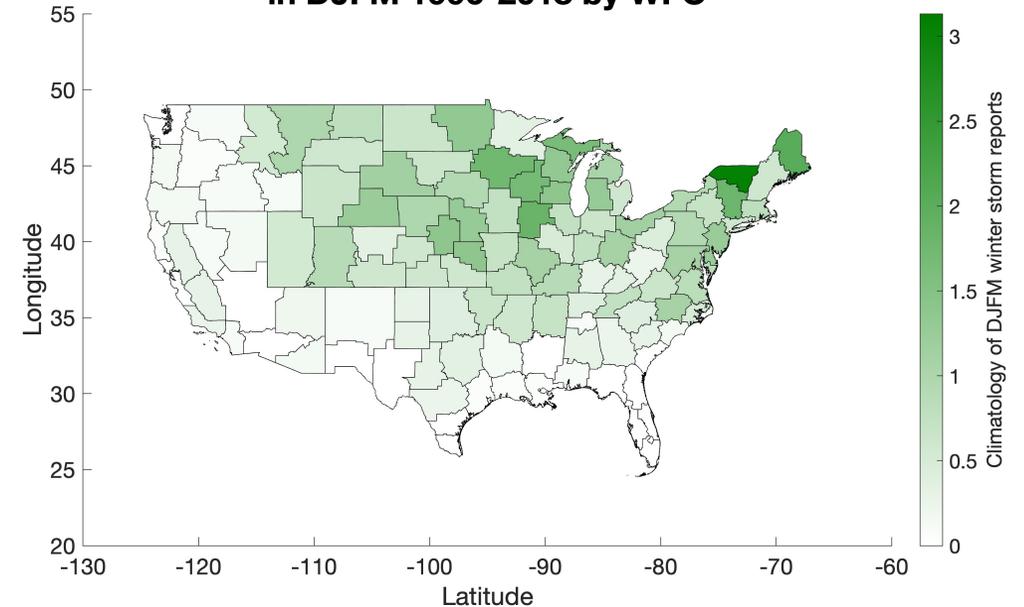

**Zone-Averaged Climatology of Heavy Snow Reports in DJFM 1996-2018 by WFO**

**Zone-Averaged Climatology of Ice Storm Reports in DJFM 1996-2018 by WFO**

**Zone-Averaged Climatology of Winter Storm Reports in DJFM 1996-2018 by WFO**

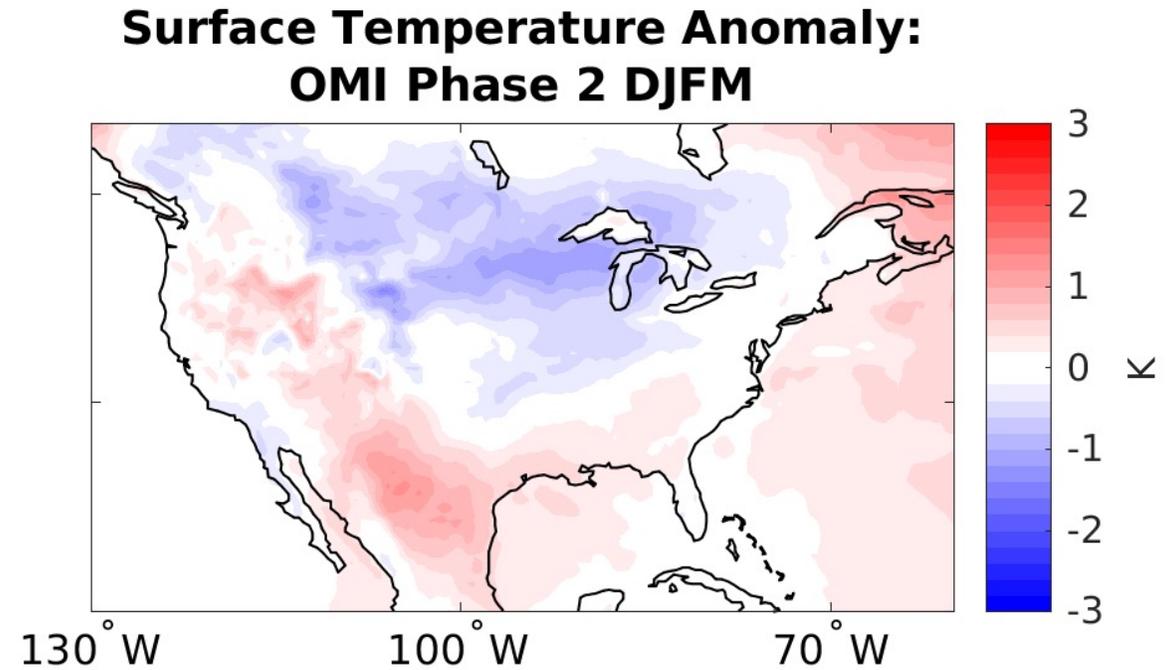

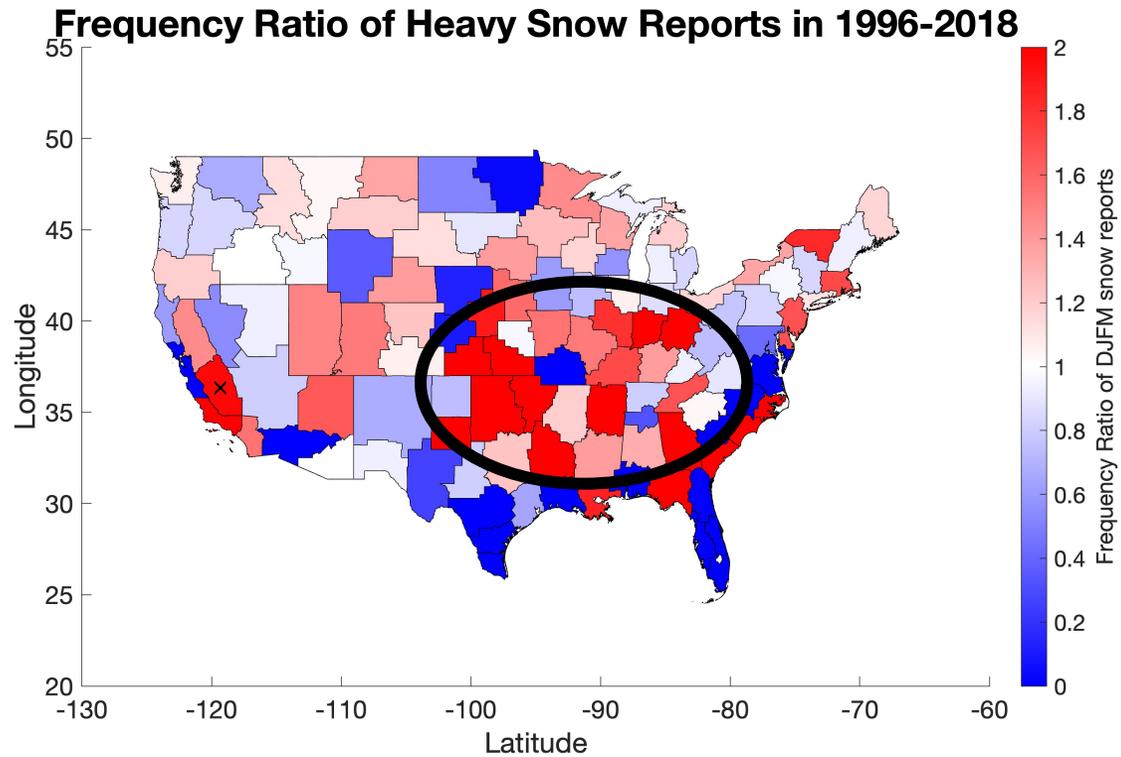

# Definition of Frequency Ratio

$$\text{frequency of storms per MJO phase} = \frac{\text{number of reports in given phase}}{\text{number of zones in WFO} \times \text{number of days in given phase}}$$

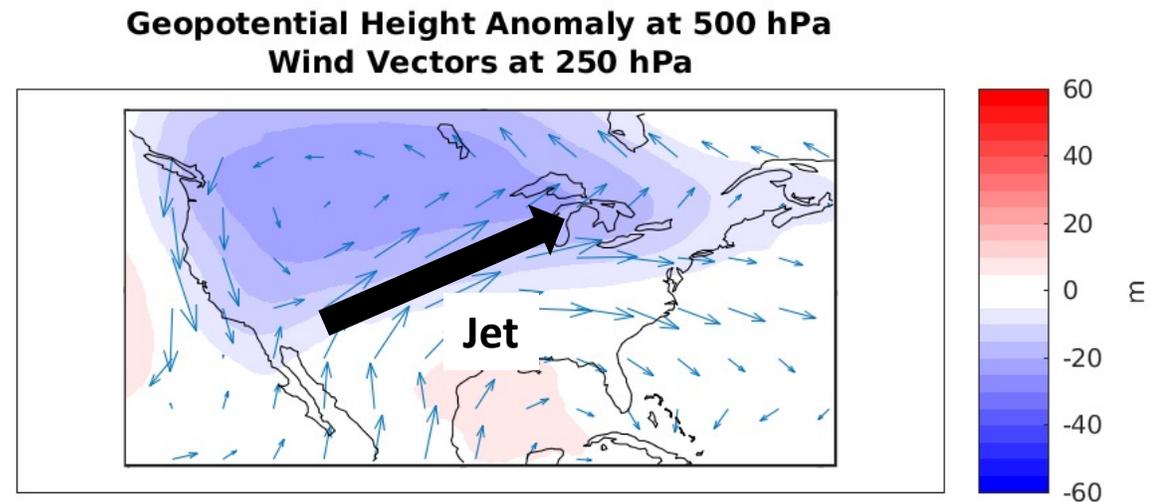

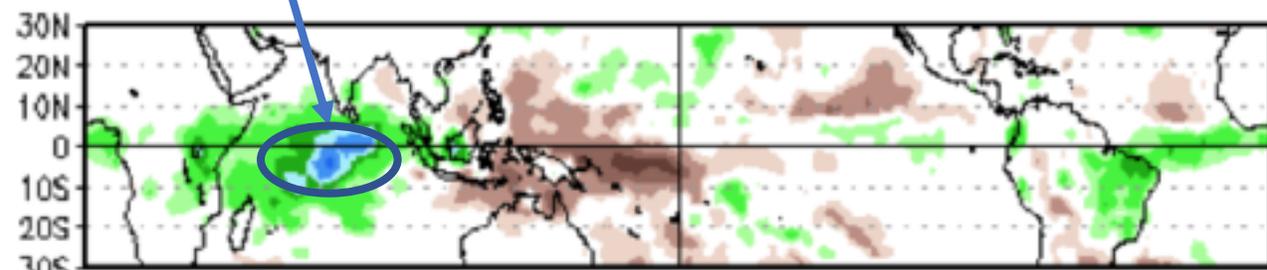

$$\text{frequency ratio} = \frac{\text{frequency of storms per MJO phase}}{\text{climatological frequency}}$$

- Frequency ratio  $> 1$   $\rightarrow$  winter weather more frequent than climatology
- Frequency ratio  $< 1$   $\rightarrow$  winter weather less frequent than climatology

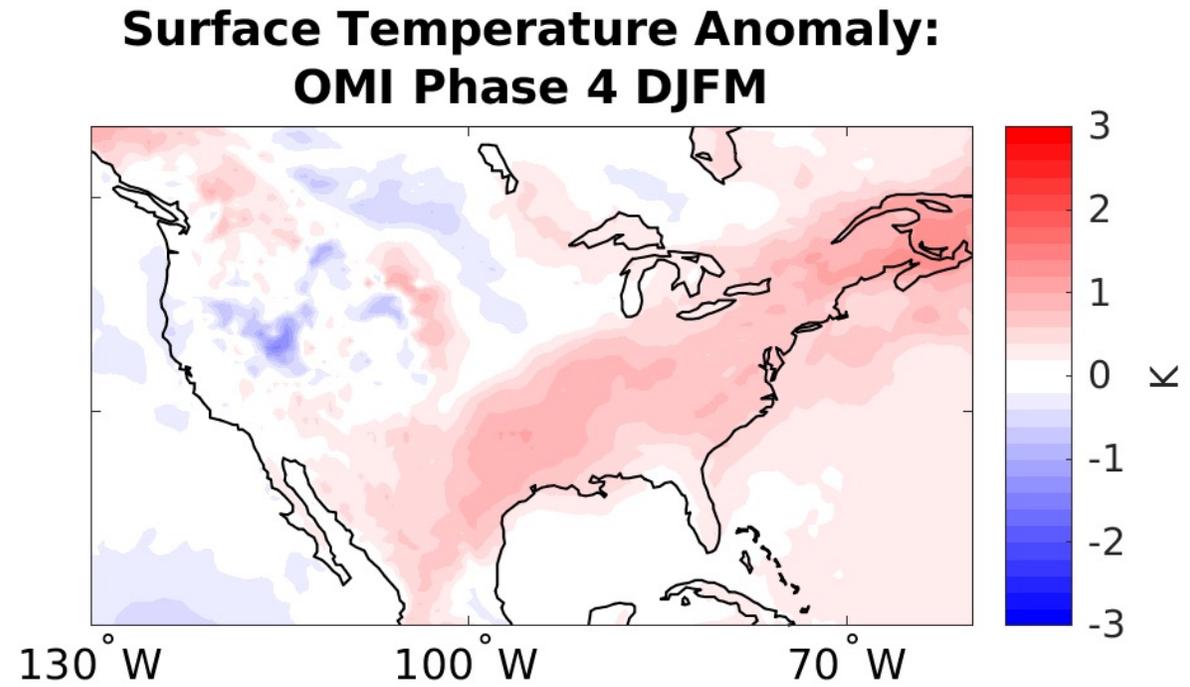

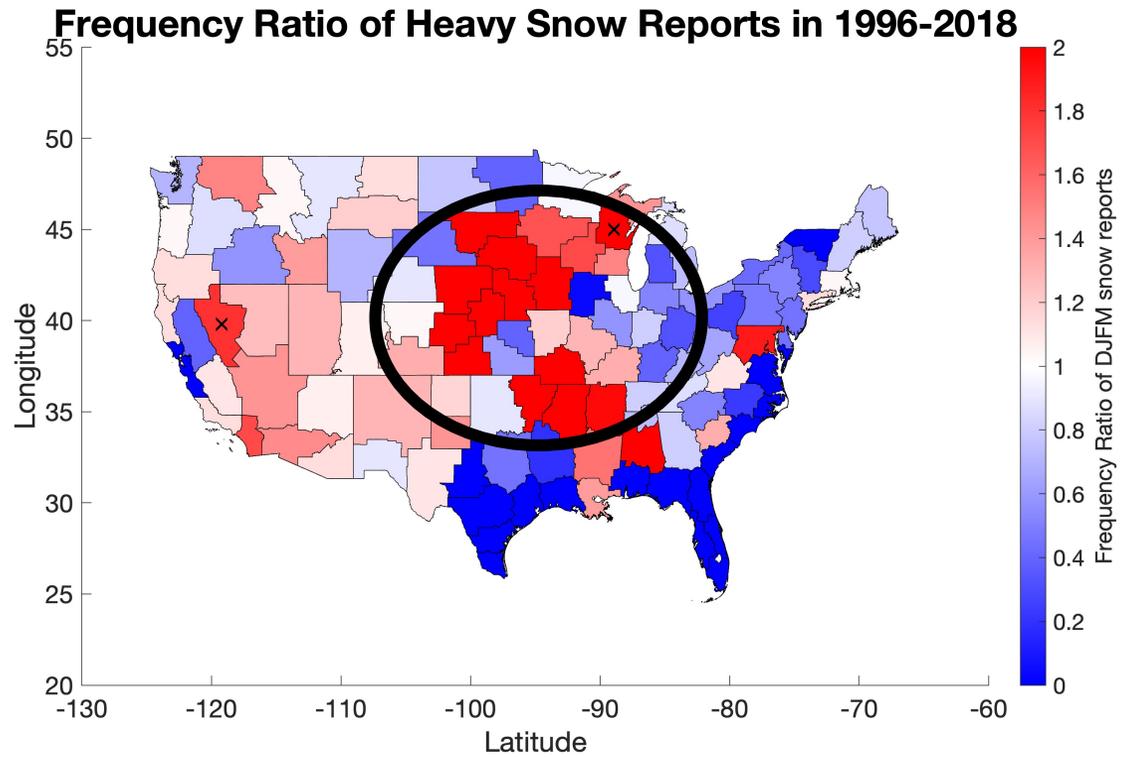

# Heavy Snow Frequency Ratios Phase 2

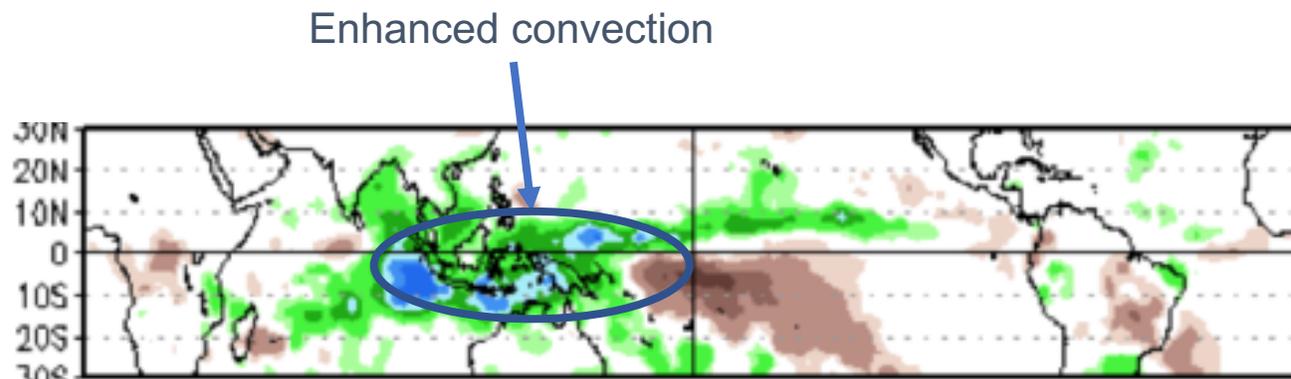

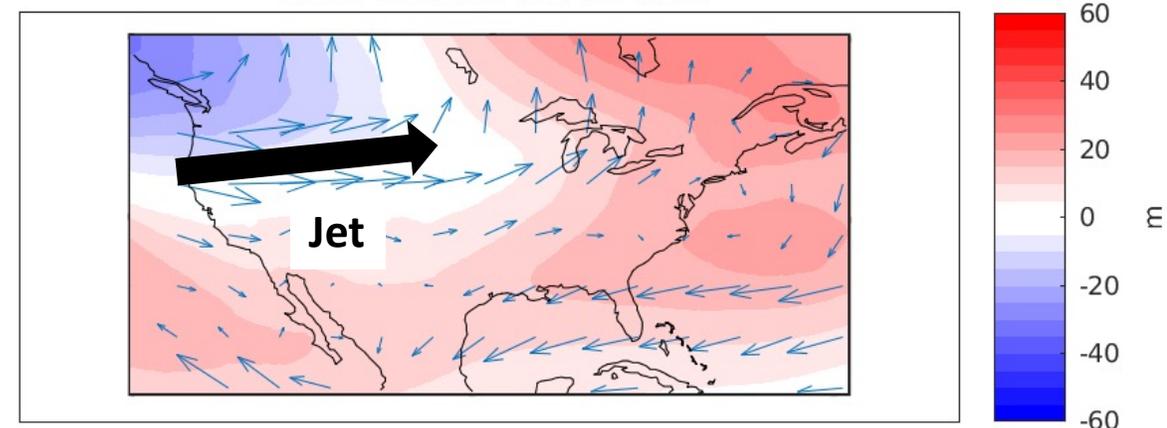

Enhanced convection

# Heavy Snow Frequency Ratios Phase 4

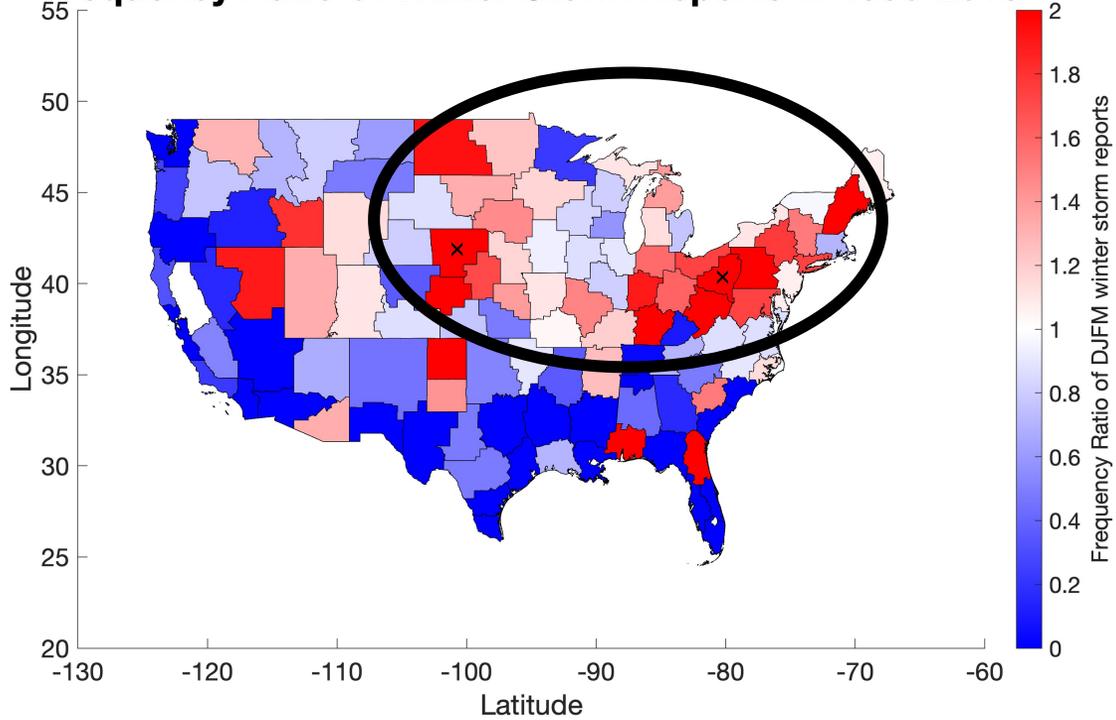

**Geopotential Height Anomaly at 500 hPa**  
**Wind Vectors at 250 hPa**

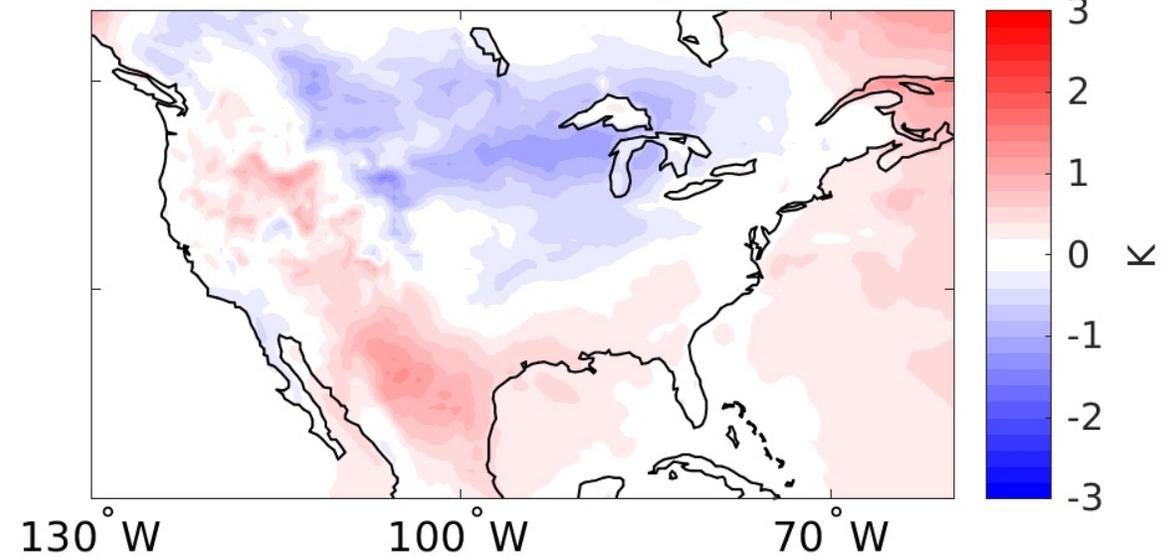

# Winter Storm Frequency Ratios Phase 2

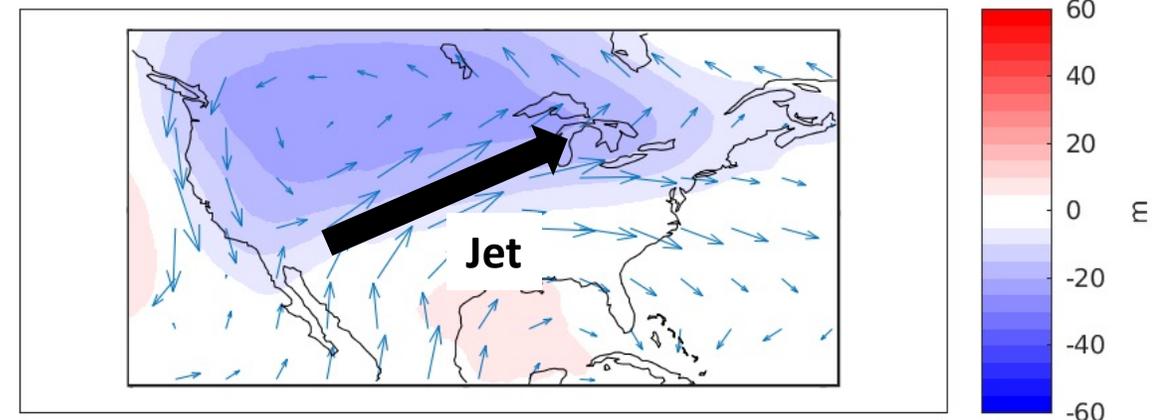

Frequency Ratio of Winter Storm Reports in 1996-2018

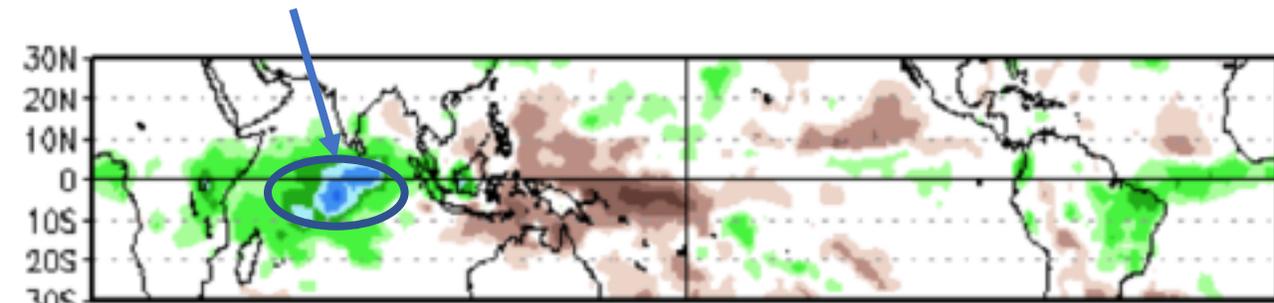

Surface Temperature Anomaly:  
OMI Phase 2 DJFM

Enhanced convection

# OMI vs. RMM comparison

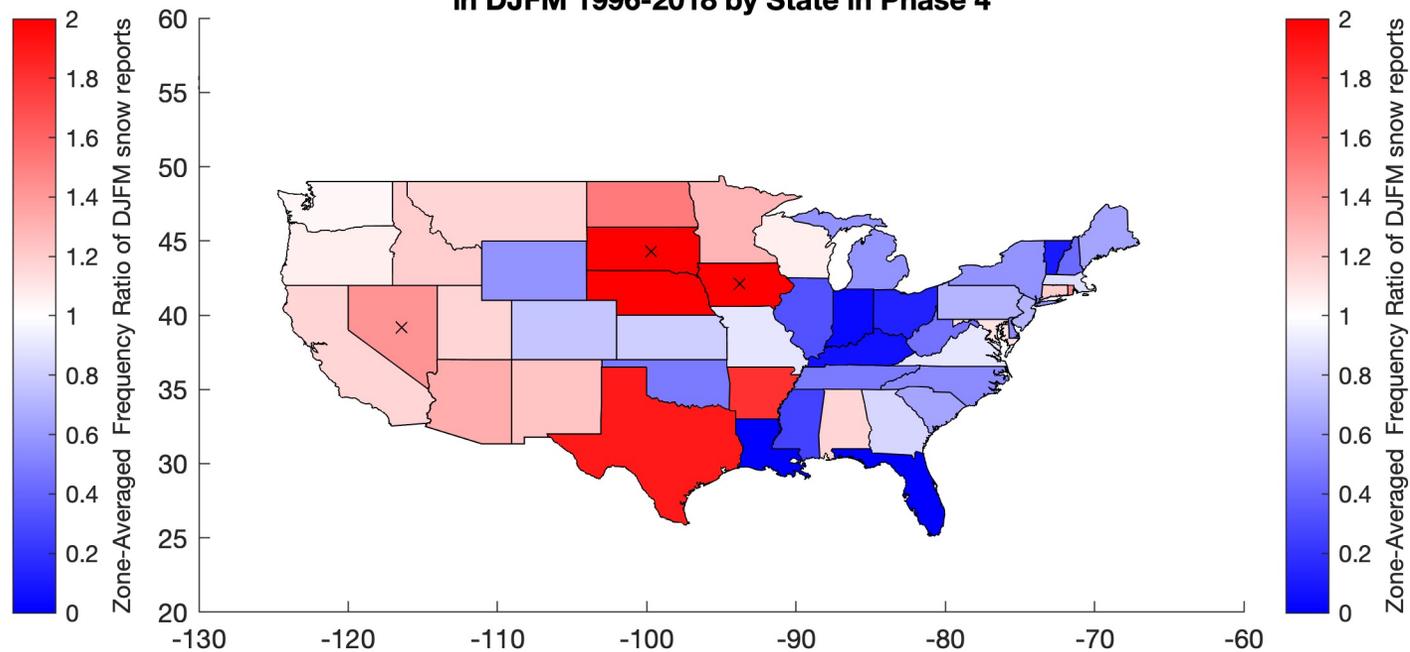

- Similar overall

Zone-Averaged Frequency Ratio of Heavy Snow Reports  
in DJFM 1996-2018 by State in Phase 4

OMI

Zone-Averaged Frequency Ratio of Heavy Snow Reports  
in DJFM 1996-2018 by State in Phase 4

RMM

# Summary of Current Results

- Frequency of winter weather affected by MJO phase
  - Robust against MJO index used
  - Impacts depend highly on storm type and region

- Frequency table

	Phase 2 (cold)	Phase 4 (warm)
Heavy snowstorms	Higher	Higher
Winter storms	Lower	Higher
Ice storms	Higher	Lower

- **MJO impact on winter weather not strictly based on temperature**
- Other possible mechanisms include dynamical forcings or moisture
  - These mechanisms will be explored more in future work

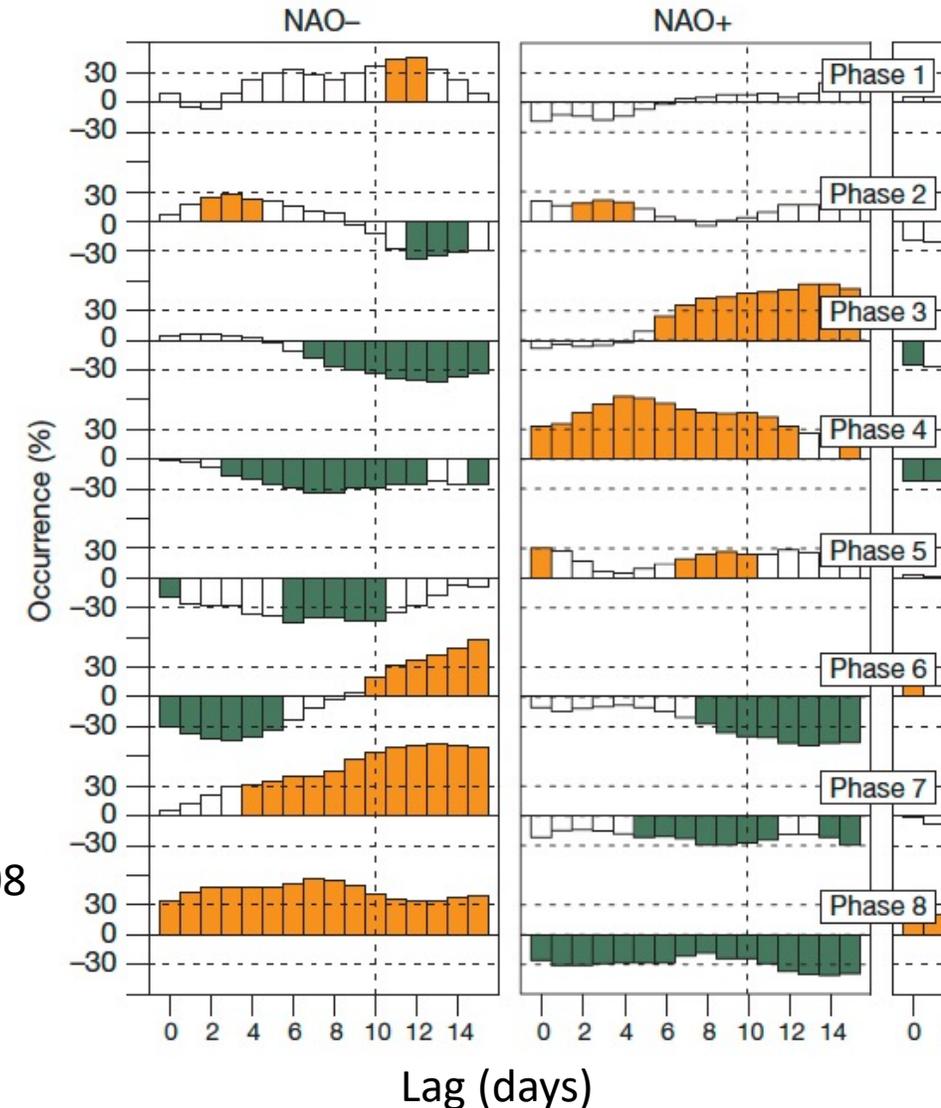

# MJO and Blocking

- Blocking is occurrence of a “persistent anticyclonic flow anomaly” (Carrera et al. 2004)
- Diverts jet meridionally
- Shifts storm tracks
- MJO associated with **Atlantic blocking regimes** (Cassou 2008)
  - e.g. North Atlantic Oscillation (NAO)

Figure source: Cassou 2008

## Lagged relationship between MJO and NAO

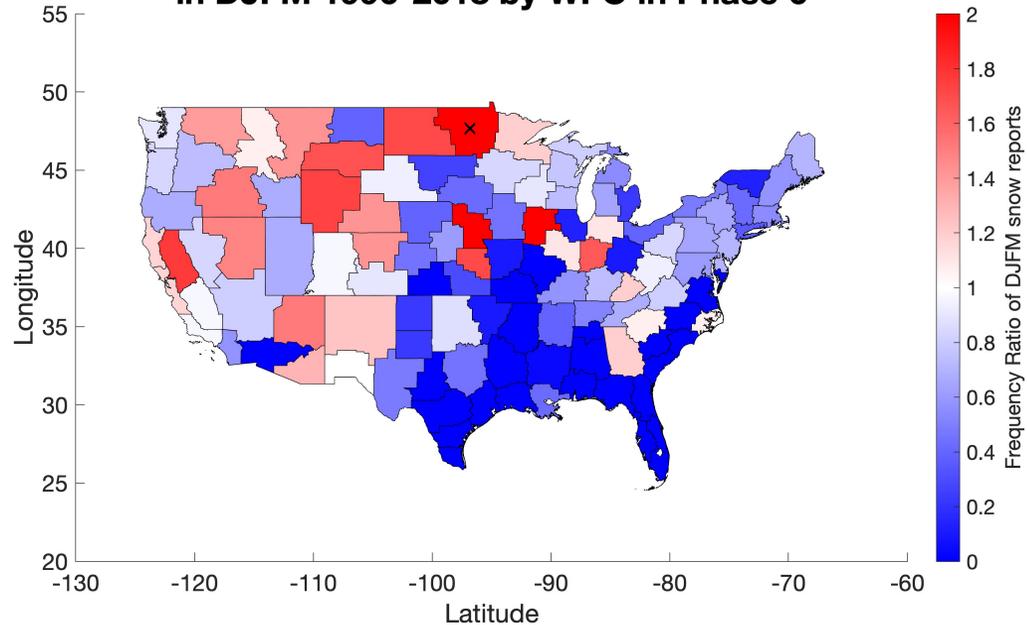

# Future Work

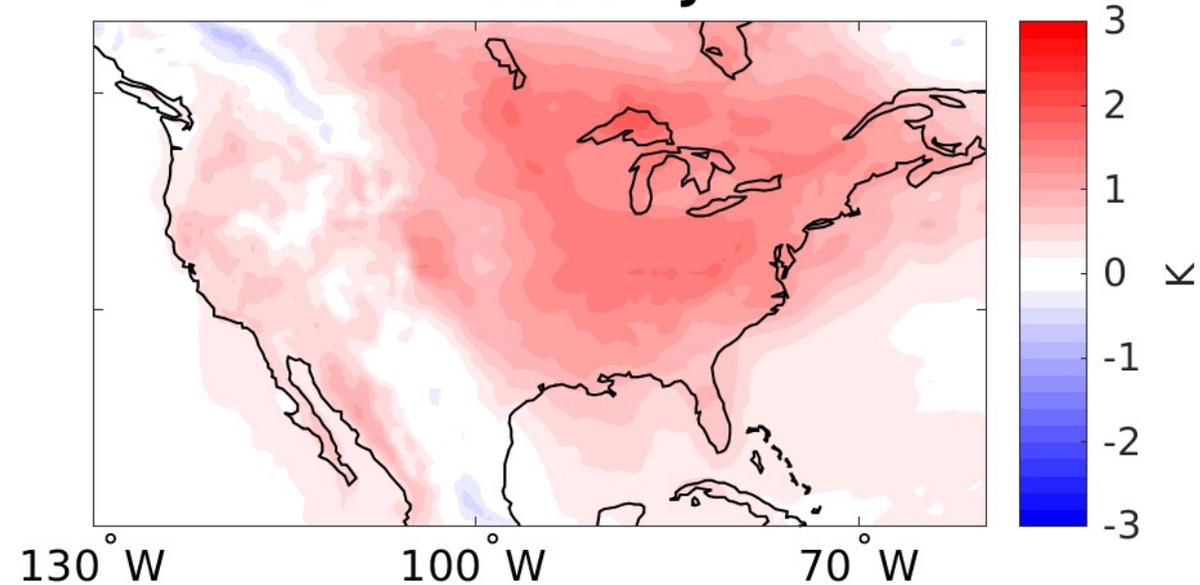

- Currently working on analyzing 850 hPa temperatures and flow pattern to see what impacts the MJO has on it
  - 850 hPa relative humidity
- Analyze composites based days with winter storms in database to compare to composites based on MJO
- Caveats of Storm Database, working to confirm with station data

# Heavy Snow Frequency Ratios Phase 6

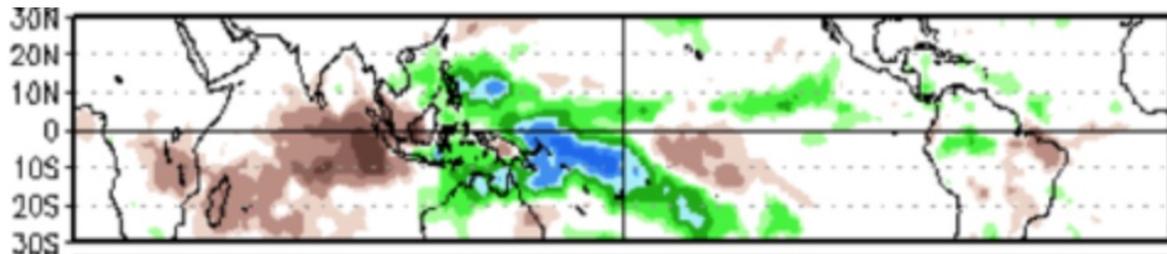

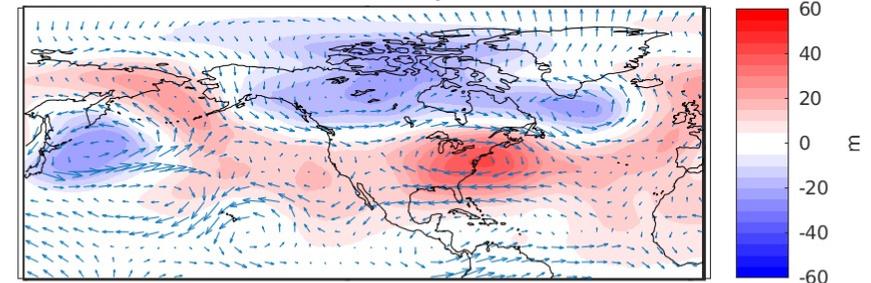

**Zone-Averaged Frequency Ratio of Heavy Snow Reports in DJFM 1996-2018 by WFO in Phase 6**

**Temperature Anomaly at 1000 hPa: OMI Phase 6 DJFM**

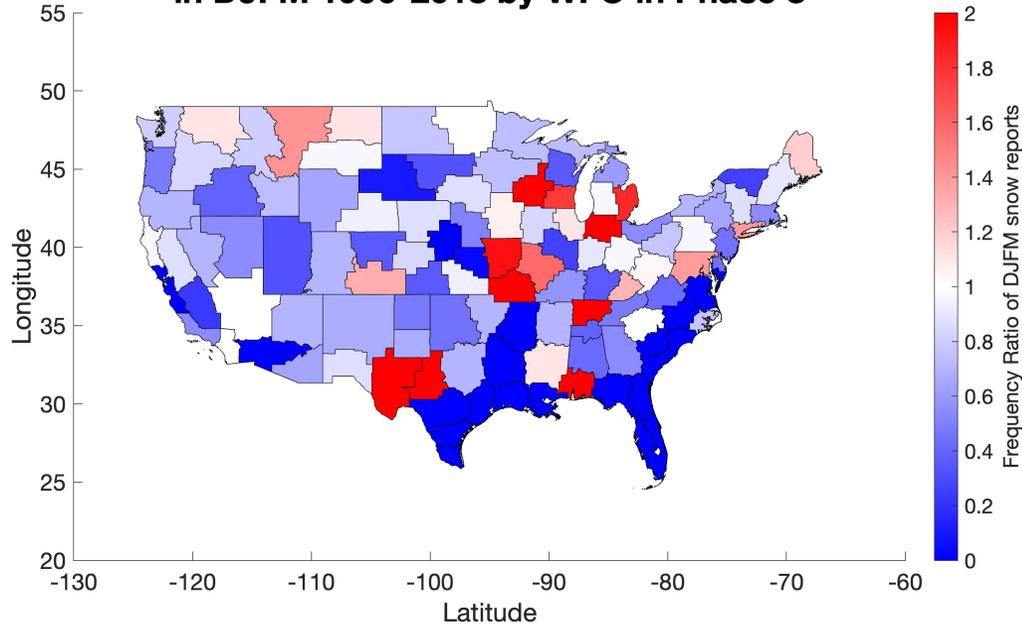

**Geopotential Height Anomaly at 500 hPa with Wind Vectors at 250 hPa: OMI Phase 6 DJFM**

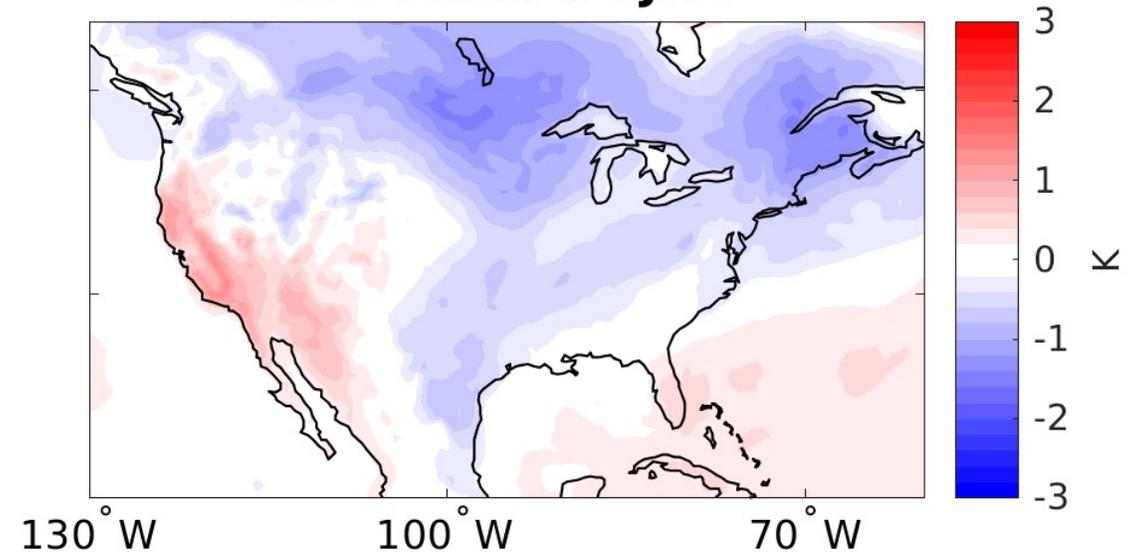

Phase 6

# Heavy Snow Frequency Ratios Phase 8

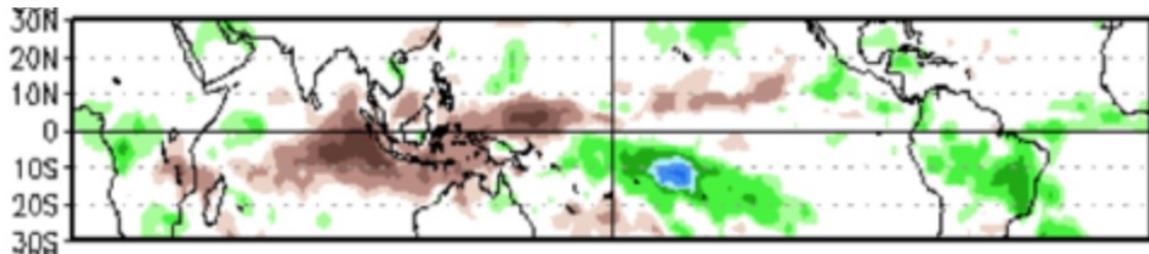

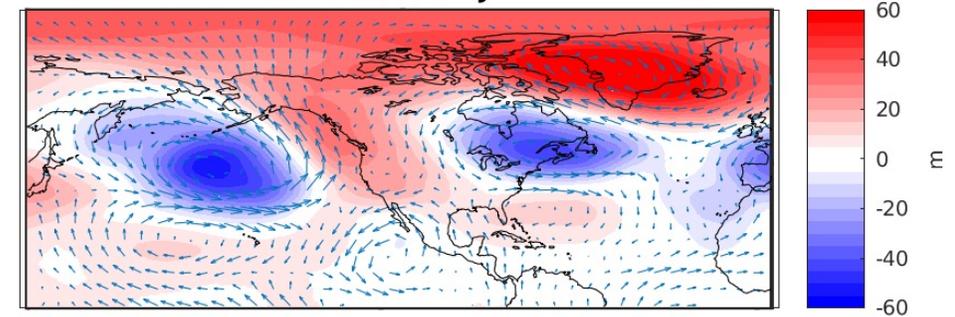

**Zone-Averaged Frequency Ratio of Heavy Snow Reports in DJFM 1996-2018 by WFO in Phase 8**

**Temperature Anomaly at 1000 hPa: OMI Phase 8 DJFM**

**Geopotential Height Anomaly at 500 hPa with Wind Vectors at 250 hPa: OMI Phase 8 DJFM**

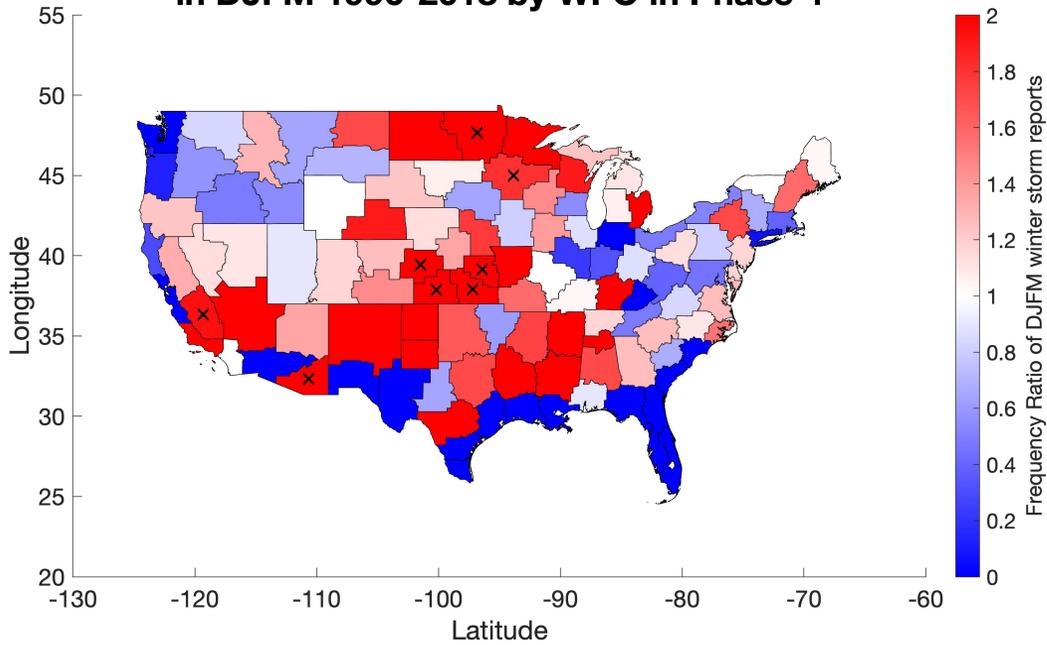

Phase 8

# WFO vs. State Comparison

- Similar overall pattern

**Zone-Averaged Frequency Ratio of Winter Storm Reports in DJFM 1996-2018 by WFO in Phase 4**

**Zone-Averaged Frequency Ratio of Winter Storm Reports in DJFM 1996-2018 by State in Phase 4**
